Chapter 1 General information	. 20
1 Manual history	20
1.1 Publications	22
1.2 Release information	22
2 Safety guidelines	23
2.1 Organization of notices	23
2.2 General information	
2.3 Qualified personnel	23
2.4 Intended use	
2.5 Safety technology disclaimer	
2.6 Protection against electrostatic discharge	
2.6.1 Packaging	
2.6.2 Guidelines for proper ESD handling	
2.7 Transport and storage	
2.8 Handling and installation	
2.9 Operation	
2.9.1 Protection against touching electrical parts	
2.9.2 Protection against hazardous movements	
2.10 Functional safety data and specifications	
3 Environmentally friendly disposal	
3.1 Separation of materials	
4 Security concept	28
Objection 0. A CODOC-coult: CofeMOTION	00
Chapter 2 ACOPOSmulti SafeMOTION	
1 Configuration of an ACOPOSmulti drive system	
2 Status indicators	
2.1 8BVI SafeMOTION inverter modules	
2.1.1 1-axis modules	
2.1.2 2-axis modules	
2.1.3 RDY, RUN, ERR (8BVI, 8BVP, 8B0P) - LED status indicators	
2.1.4 POWERLINK - LED status indicators	
2.1.5 Backup battery (ACOPOSmulti SafeMOTION EnDat 2.2) - LED status indicators	
2.1.6 SafeMOTION module - LED status indicators	
2.1.7 Status changes when starting up the operating system loader	
2.1.8 Setting the POWERLINK node number	
3 Data sheets	
3.1 Module overview	
3.2 Safe single-width inverter modules (1-axis modules)	
3.2.1 8BVI0014HCSS.000-1, 8BVI0014HWSS.000-1, 8BVI0014HCSA.000-1, 8BVI0014HWSA.000-1	
3.2.2 8BVI0028HCSS.000-1, 8BVI0028HWSS.000-1, 8BVI0028HCSA.000-1, 8BVI0028HWSA.000-1	
3.2.3 8BVI0055HCSS.000-1, 8BVI0055HWSS.000-1, 8BVI0055HCSA.000-1, 8BVI0055HWSA.000-1 3.2.4 8BVI0110HCSS.000-1, 8BVI0110HWSS.000-1, 8BVI0110HCSS.000-1, 8BVI0110HWSA.000-1	
3.2.5 Wiring: Safe single-width inverter modules (1-axis modules)	
3.3 Safe double-width inverter modules (1-axis modules)	
· · · · · · · · · · · · · · · · · · ·	
3.3.1 8BVI0220HCSS.000-1, 8BVI0220HWSS.000-1, 8BVI0220HCSA.000-1, 8BVI0220HWSA.000-1	
3.3.2 8BVI0330HCSS.000-1, 8BVI0330HWSS.000-1, 8BVI0330HCSA.000-1, 8BVI0330HWSA.000-1 3.3.3 8BVI0440HCSS.000-1, 8BVI0440HWSS.000-1, 8BVI0440HWSA.000-1	
3.3.4 Wiring: Safe double-width inverter modules (1-axis modules)	
3.4 Safe single-width inverter modules (2-axis modules)	
3.4.1 8BVI0014HCDS.000-1, 8BVI0014HWDS.000-1	
3.4.2 8BVI0028HCDS.000-1, 8BVI0028HWDS.000-1	
3.4.4 Wiring: Safe single-width inverter modules (2-axis modules)	
3.5 Safe double-width inverter modules (2-axis modules)	
3.5.2 8BVI0220HCDS.000-1, 8BVI0220HWDS.000-1	
3.5.3 Wiring: Safe double-width inverter modules (2-axis modules)	
5.5.5 Trining. Outo double width inverter inloudies (2-axis inloudies)	

3.6 Safe 4x width inverter modules (1-axis modules)	
3.6.1 8BVI0660HCSS.000-1, 8BVI0660HWSS.000-1, 8BVI0660HCSA.000-1, 8BVI0660HWSA.000-1	118
3.6.2 8BVI0880HCSS.004-1, 8BVI0880HWSS.004-1, 8BVI0880HCSA.004-1, 8BVI0880HWSA.004-1	123
3.6.3 Wiring: Safe 4x width inverter modules (1-axis modules)	130
3.7 Safe 8x width inverter modules (1-axis modules)	
3.7.1 8BVI1650HCSS.000-1	
3.7.2 Wiring: Safe 8x width inverter modules (1-axis modules)	
4 Installation	
5 Dimensioning	149
6 Wiring	
6.1 General information	
6.1.1 EMC-compatible installation	
6.1.2 Overview	
6.1.3 Ground and shield connection diagrams	
6.1.4 Insulation and high voltage testing	158
OL (0.400DOO (0.5 MOTION	400
Chapter 3 ACOPOSmotor SafeMOTION	
1 System characteristics	
1.1 Compact and safe	
1.2 Decentralized and flexible	
1.3 Homogeneous and compatible	
1.4 Cooling	
1.5 ACOPOSmotor SafeMOTION	
1.6 ACOPOSmotor configurations	
1.7 Order key	
1.7.1 Size (c)	
1.7.2 Length (d)	
1.7.3 Safety technology (e)	
1.7.4 Encoder system (ff)	
1.7.5 Nominal speed (ggg)	
1.7.6 Electronics options (h)	
1.7.7 Motor options (i)	
1.7.8 Version	
1.8 8ZDFB fan kits	
1.9 Load capacity of the shaft end and bearings	
1.10	
2 Status indicators	
2.1 ACOPOSmotor SafeMOTION	
2.1.1 LED status indicators	
2.1.2 RDY/ERR - LED status indicators	
2.1.3 POWERLINK - LED status indicators	
2.1.4 SafeMOTION module - LED status indicators	
2.1.5 Status changes when starting up the operating system loader	
2.1.6 POWERLINK node number setting	
3 Data sheets	
3.1 ACOPOSmotor SafeMOTION modules	
3.1.1 ACOPOSmotor SafeMOTION with electronics options - Order data	
3.1.2 ACOPOSmotor SafeMOTION without electronics options - Order data	
3.1.3 Technical data	
3.1.4 Size 3	
3.1.5 Size 4	
3.1.6 Size 5	
3.1.7 Pinouts	
3.1.8 POWERLINK node number setting	
3.2 Accessories	
3.2.1 Cables	
3.2.2 Fan kits	197

3.3 Installation	202
3.3.1 Dimension diagrams and installation dimensions	
3.4 Dimensioning	
Chapter 4 ACOPOS P3 SafeMOTION	205
1 Technical data	
1.1 SafeMOTION - Order key	
1.1.2 Plug-in modules (i)	
1.2 8EI SafeMOTION servo drives	
1.2.1 Status indicators	
1.2.2 1-axis modules	
1.2.3 2-axis modules	
1.2.4 3-axis modules	
1.2.5 Wiring	
1.3 Setting POWERLINK node numbers	
2 Installation	
3 Dimensioning	
4 Wiring	
Chantau F Cristaus abayastaviatias	200
Chapter 5 System characteristics	
1 Integrated (network-based) safety technology - SafeMOTION	
1.1 General information	
1.1.1 ACOPOS multi SafeMOTION and ACOPOSmotor SafeMOTION	
1.1.2 ACOPOS P3 SafeMOTION	
1.2 Safety functions	
2 Integrated safety technology	
3 System requirements	
5 Safety response time	
5.1 Signal processing on the safe B&R input module	
5.2 Data transmission time on the bus	
5.3 Signal processing on the safe B&R output module	
5.4 Signal processing on the safe B&R SafeMOTION module	
5.5 Calculating the safety response time	
5.6 Parameters for the safety response time in SafeDESIGNER	
5.7 Minimum signal lengths	
6 Detecting errors within the module	
Chantan C Cafaty tacking lawy	070
Chapter 6 Safety technology	
1 Integrated safety technology - SafeMOTION	
1.1 General information	
1.2 Safe power transmission system	
1.2.2 ACOPOSmulti SafeMOTION SinCos	
1.2.3 ACOPOSmotor SafeMOTION EnDat 2.2	
1.2.4 B&R motors / Encoder list	
1.3 The idle current principle	
2 Principle - Implementing safety functions	
2.1 Safe pulse disabling	
2.1.1 ACOPOSmulti SafeMOTION inverter module	
2.1.2 ACOPOSmotor SafeMOTION module	
2.1.3 ACOPOS P3 SafeMOTION module	
2.2 Safe motor holding brake output	
2.2.1 ACOPOSmulti SafeMOTION inverter module	
2.2.2 ACOPOSmotor SafeMOTION module	
2.2.3 ACOPOS P3 SafeMOTION servo drives	
2.3 Safe encoder input

Chapter 1 • General information

1 Manual history

Information:

This user's manual is only valid together with the "ACOPOSmulti" (MAACPM-ENG), "Decentralized motion control" (MAACPMDDE-ENG) and "Integrated safety technology" (MASAFETY-ENG) user's manuals.

Information:

B&R makes every effort to keep user's manuals as current as possible. From a safety point of view, however, the current version must be downloaded from the B&R website (www.br-automation.com).

Version	Date	Comment
4.6	2019-08-01	Chapter "Safety technology / Integrated safety functions": Added new parameter "Encoder monitoring - Safe Encoder Mounting", updated description "Accuracy of current measurement" for SBTA/SLT, updated SafeMOTION Help Tool V6.0. ACOPOS P3 safety characteristics: Safe Operating Stop (SOS), Safe Stop 1 (SS1), Safe Stop 2 (SS2), Safely Limited Speed (SLS), Safe Direction (SDI), Safely Limited Increment (SLI), Safely Limited Acceleration (SLA), Safe Maximum Speed (SMS), Safely Limited Position (SLP), Safe Maximum Position (SMP), Safe Homing - Adjusted values.
4.5	2018-11-06	Added chapter "Safety technology / Integrated safety functions: Blackout mode, Safe Speed Observer, Safely Limited Torque". Added new parameter "SSO - External load enabled".
4.4	2017-11-13	Chapter "Safety technology": Added new parameter "FFS - Caused by encoder error" for FUNCTIONAL FAIL SAFE.
4.3	2017-07-13	Chapter ACOPOS P3 SafeMOTION / Technical data / 8EI SafeMOTION servo drives: Added 1-axis modules.
4.2	2016-12-12	Added chapter "ACOPOS P3 SafeMOTION". Chapter "System characteristics / Safety functions": Added table "ACOPOS P3 SafeMOTION". Chapter "System characteristics / System requirements": Added "ACOPOS P3 SafeMOTION". Added chapter "Safety technology / Integrated safety technology - SafeMOTION / Safe power transmission system / ACOPOS P3 SafeMOTION". Chapter "Safety technology / Configuring the safety functions / Safe pulse disabling": Added "ACOPOS P3 SafeMOTION".
		Chapter "Safety technology / Configuring the safety functions / Safe motor holding brake output": Added "ACOPOS P3 SafeMOTION". Added chapter "Safety technology / Safety characteristics - ACOPOS P3 SafeMOTION". Chapter "Safety technology / Integrated safety functions / Safe machine options": Added data structure for ACOPOS P3 SafeMOTION.
		Chapter "Safety technology / SafeMOTION register description / Parameters in the I/O configuration of the SafeMOTION module":
		Group "Encoders": Modified description.
		Group: Safety features: Added axis 1.
		Group: Safety features: Added axis 2.
		Group: Safety features: Added axis 3.
		Chapter "Safety technology / SafeMOTION register description / Parameters in SafeDESIGNER": Added information regarding SafeMOTION parameters for ACOPOS P3 SafeMOTION. Chapter "Safety technology / SafeMOTION register description / Channel list": Added channel list for ACOPOS P3 SafeMOTION. Chapter "Safety technology / Programming the safety application":
		Modified figure "Inverter unit timing".
		SafeMOTION Help Tool: Updated for ACOPOS P3 SafeMOTION / openSAFETY.
		Application in SafeDESIGNER: Added table "Library openSAFETY Bur Motion SF".
		 Accessing data on the SafeMOTION module / ACOPOS parameter ID: Added status and control bits for ACOPOS P3 SafeMOTION.
		 Library SafeMC: Added description of function blocks READ_SAFEOUT_DATA2 (read SafeOUT data 2) and READ_SAFEIN_DATA2 (read SafeIN data 2).
		Chapter "PLCopen Safety": Replaced figures for function blocks in library PLCopen_Motion_SF_2 for harmonization purposes. Chapter "PLCopen Safety": Added description of library openSAFETY_BuR_Motion_SF. Chapter "Standards and certifications": Added ACOPOS P3, harmonized with user's manual standards. Appendix: Added overview of safety level for safety functions used by the ACOPOS product family.
4.1	2016-10-10	Added chapter "ACOPOSmotor SafeMOTION". Chapter "System characteristics / Safety functions": Added table "ACOPOSmotor SafeMOTION". Chapter "System characteristics / System requirements": Added ACOPOSmotor SafeMOTION. Added chapter "Safety technology / Integrated safety technology - SafeMOTION / Safe power transmission system / ACOPOSmotor SafeMOTION". Chapter "Safety technology / Configuring the safety functions / Safe pulse disabling": Added ACOPOSmotor SafeMOTION. Chapter "Safety technology / Configuring the safety functions / Safe motor holding brake output": Added ACOPOSmotor SafeMOTION. Added chapter "Safety technology / Safety characteristics - ACOPOSmotor SafeMOTION".

		Version 1.00	2010-03-26	Comment Start of ravision history publication
		2.2	2012-03-20	Start of revision history publication Updated manual for Safety Release 1.4.
		2.3	2012-09-24	Chapter "General information": Disclaimer added
		2.0	2012-03-24	Chapter "System characteristics": Added "Detection of errors within the module". Chapter "Safety technology / Integrated safety technology in the ACOPOSmulti with SafeMC / The safe power transmission system": Updated encoder options and danger notice.
				Chapter "Safety technology / Safety characteristics": Added danger warning about measuring instruments.
		2.4	2014-02-17	Chapter "General information / Protection against touching electrical parts": Updated danger warning. Chapter "ACOPOSmulti with SafeMC": Added information about motor and encoder ca-
				bles sorted by model number and danger warning about safe motor holding brake (X4A/ X4B connectors). Chapter "ACOPOSmulti with SafeMC / Overview": Added additional PE connection for
				8BVE expansion modules. Chapter "Safety technology / The safe power transmission system": Added information about motor cables.
				Chapter "Safety technology / Principle - Implementing safety functions": Changed danger warning. Chapter "Safety technology / Safe motor holding brake output": Added danger warning
				about safe motor holding brake output. Chapter "Safety technology / Encoder mounting with proof of fatigue strength": Changed
				title (previously "Fault exclusion"). Chapter "Safety technology / Encoder mounting without proof of fatigue strength – Safe lag error monitoring": Shared content with ACOPOSmulti with SafeMC SinCos user's manual
				(previously "Safe monitoring without fault exclusion"). Chapter "Safety technology / Safety characteristics of integrated safety functions": Updated description of Safe Operating Stop (SOS).
				Chapter "Safety technology / Integrated safety functions": Added SafePosition, SafeSpeed. Chapter "Safety technology / Parameters in the I/O configuration of the SafeMC module":
				Removed group "General, Parameters". Chapter "Safety technology / Programming the safety application": Added SBT with reference to ACOPOSmulti SafeMC SinCos, shared content. Chapter "Safety technology," Programming the safety application / SafeMC Help Teal":
				Chapter "Safety technology / Programming the safety application / SafeMC Help Tool": Updated Safe Brake Test (SBT). Chapter "Safety technology / Application in SafeDESIGNER": Added reference to
				ACOPOSmulti SafeMC SinCos, shared content. Chapter "Safety technology / ACOPOSmulti parameter IDs": Shared content with ACOPOSmulti SafeMC SinCos, update.
				Chapter "Safety technology / Library "SafeMC": Optimized and restructured description, added SBT (shared content with ACOPOSmulti SafeMC SinCos). Chapter "Safety technology / Replacing a safe encoder/motor": Shared content with
				ACOPOSmulti with SafeMC SinCos user's manual. Chapter "PLCopen Safety / SF_SafeMC_BR_V2": Section "Integrated safety functions" identical to section "Integrated safety functions" in chapter "Safety technology".
				Chapter "PLCopen safety / Encoder mounting with proof of fatigue strength": Shared content with ACOPOSmulti with SafeMC SinCos user's manual (previously "Fault exclusion"). Chapter "PLCopen Safety / Encoder mounting without proof of fatigue strength – Safe lag
				error monitoring": Shared content with ACOPOSmulti with SafeMC SinCos user's manual (previously "Safe monitoring without fault exclusion"). Chapter "Standards and certifications": Removed EN 954-1, changein accordance with
				IFA (previously BGIA) 2/2012, Additional environmental limit values in accordance with EN 61800-2: Removed footnote.

2 Safety guidelines

2.1 Organization of notices

Safety notices

Contain **only** information that warns of dangerous functions or situations.

Signal word	Description
Danger!	Failure to observe these safety guidelines and notices will result in death, severe injury or substantial damage to property.
Warning!	Failure to observe these safety guidelines and notices can result in death, severe injury or substantial damage to property.
Caution!	Failure to observe these safety guidelines and notices can result in minor injury or damage to property.
Notice!	Failure to observe these safety guidelines and notices can result in damage to property.

General notices

Contain **useful** information for users and instructions for avoiding malfunctions.

Signal word	Description	
Information:	Jseful information, application tips and instructions for avoiding malfunctions.	

2.2 General information

B&R drive systems and servo motors have been designed, developed and manufactured for conventional use in industrial environments.

They were not designed, developed and manufactured for any use involving serious risks or hazards that could lead to death, injury, serious physical impairment or loss of any kind without the implementation of exceptionally stringent safety precautions.

In particular, these risks include the use of these devices to monitor nuclear reactions in nuclear power plants, in flight control or flight safety systems as well as in the control of mass transportation systems, medical life support systems or weapons systems.

Servo drives, inverter modules and frequency inverters from B&R are not dual-use goods per Annex I of Council Regulation (EC) No. 428/2009 | 3A225 as amended by Commission Delegated Regulation (EU) No. 2015/2420. The electrical output frequency of these modules is monitored; if the limit frequency is exceeded, the current movement is aborted and an error is reported.

Servo drives, inverter modules and frequency inverters with the dual-use option are dual-use goods per Annex I of Council Regulation (EC) No. 428/2009 | 3A225 as amended by Commission Delegated Regulation (EU) No. 2015/2420.

The electrical output frequency of these modules is not monitored.

Modules with the dual-use option are subject to various export restrictions.

Danger!

Drive systems and servo motors can have exposed parts with voltages applied (e.g. terminals) or hot surfaces. Additional hazards include moving machine parts. The removal of required covers, inappropriate use of the devices or their improper installation or operation can result in severe personal injury or damage to property.

All tasks such as the transport, installation, commissioning and servicing of devices are only permitted to be carried out by qualified personnel. Qualified personnel are those familiar with the transport, mounting, installation, commissioning and operation of devices who also have the appropriate qualifications to perform these tasks. National accident prevention regulations must be observed.

The safety notices, information about connection conditions (nameplate and documentation) and limit values specified in the technical data must be read carefully before installation and commissioning and are to be observed in all cases.

2.3 Qualified personnel

Use of safety-related products is restricted to the following persons:

- Qualified personnel who are familiar with relevant safety concepts for automation technology as well as applicable standards and regulations
- Qualified personnel who plan, develop, install and commission safety equipment in machines and systems

General information • Safety guidelines

Qualified personnel in the context of this manual's safety guidelines are those who, because of their training, experience and instruction combined with their knowledge of relevant standards, regulations, accident prevention guidelines and operating conditions, are qualified to carry out essential tasks and recognize and avoid potentially dangerous situations.

In this regard, sufficient language skills are also required in order to be able to properly understand this manual.

2.4 Intended use

Servo drives are components designed to be installed in electrical systems or machines. They are not permitted to be used unless the machine meets directive 2006/42/EC (machinery directive) as well as directive 2004/108/EC (EMC directive).

B&R drive systems are only permitted to be directly operated on grounded industrial power systems (TN, TN-C-S). When used in residential areas, commercial areas or small businesses, additional protective and filter measures must be implemented by the user.

Danger!

Drive systems are not permitted to be operated directly on TT, IT and corner-grounded TN-S systems!

Technical data as well as connection and environmental specifications can be found on the type plate and in this user's manual. Specifications regarding connection and environmental conditions must be observed!

Danger!

Electronic devices are never completely failsafe. If the drive systems fails, the user is responsible for making sure that the motor is brought to a secure state.

2.5 Safety technology disclaimer

The proper use of all B&R products must be guaranteed by the customer through the implementation of suitable training, instruction and documentation measures. The guidelines set forth in system user's manuals must be taken into consideration here as well. B&R has no obligation to provide verification or warnings with regard to the customer's purpose of using the delivered product.

Changes to the devices are not permitted when using safety-related components. Only certified products are permitted to be used. Currently valid product versions in each case are listed in the corresponding certificates. Current certificates are available on the B&R website (www.br-automation.com) in the Downloads section for the respective product. The use of non-certified products or product versions is not permitted.

All relevant information regarding these safety products must be read in the latest version of the related data sheet and the corresponding safety notices observed before the safety products are permitted to be operated. Certified data sheets are available on the B&R website (www.br-automation.com) in the Downloads section for the respective product.

B&R and its employees are not liable for any damages or loss resulting from the incorrect use of these products. The same applies to misuse that may result from specifications or statements made by B&R in connection with sales, support or application activities. It is the sole responsibility of the user to check all specifications and statements made by B&R for proper application as it pertains to safety-related applications. In addition, the user assumes sole responsibility for the proper design of the safety function as it pertains to safety-related applications.

2.6 Protection against electrostatic discharge

Electrical components that can be damaged by electrostatic discharge (ESD) must be handled accordingly.

2.6.1 Packaging

Electrical components with a housing do not require special ESD packaging but must be handled properly (see section 2.6.2 "Guidelines for proper ESD handling" on page 25).

Electrical components without a housing are protected by ESD-suitable packaging.

2.6.2 Guidelines for proper ESD handling

Electrical components with a housing

- Do not touch the connector contacts on connected cables.
- Do not touch the contact tips on circuit boards.

Electrical components without a housing

The following points apply in addition to the points listed under "Electrical components with a housing":

- Any persons handling electrical components or devices with installed electrical components must be grounded.
- Components are only permitted to be touched on their narrow sides or front plate.
- Components must always be placed on or stored in a suitable medium (ESD packaging, conductive foam, etc.).
 - Metallic surfaces are not suitable storage surfaces!
- Components must not be subjected to electrostatic discharge (e.g. caused by charged plastics).
- Observe a minimum distance of 10 cm from monitors and television sets.
- Measuring instruments and equipment must be grounded.
- Probe tips of galvanically isolated measuring instruments must be temporarily discharged on suitably grounded surfaces before taking measurements.

Individual components

- ESD protective measures for individual components are thoroughly implemented at B&R (conductive floors, footwear, arm bands, etc.).
- These special ESD protection measures for individual components are not necessary for customers handling B&R products.

2.7 Transport and storage

During transport and storage, devices must be protected against undue stress (mechanical loads, temperature, moisture, corrosive atmospheres, etc.).

Drive systems contain components sensitive to electrostatic charges that can be damaged by inappropriate handling. It is therefore necessary to provide the required protective measures against electrostatic discharge when installing or removing these drive systems.

2.8 Handling and installation

Warning!

B&R drive systems and servo motors can be heavy.

During handling and installation of heavy B&R drive systems or servo motors, there is therefore the danger of personal injury or damage to property (through shearing, impacts, cutting or crushing). Suitable protective equipment (e.g. safety glasses, protective gloves, safety shoes, etc.) must be used whenever necessary!

Installation must be performed according to this documentation using suitable equipment and tools.

Devices are only permitted to be installed by qualified personnel without voltage applied. Before installation, voltage to the control cabinet must be switched off and prevented from being switched on again.

General safety guidelines and national accident prevention regulations for working with high voltage systems must be observed.

Electrical installation must be carried out in accordance with applicable guidelines (e.g. line cross sections, fuses, protective ground connections, see also 5 "Dimensioning" on page 149).

2.9 Operation

2.9.1 Protection against touching electrical parts

Danger!

To operate drive systems, it is necessary for certain parts to carry dangerous voltage levels over 60 VDC. Touching one of these parts can result in a life-threatening electric shock. This could lead to death, severe injury or damage to property.

Before switching on a drive system, it is important to ensure that it is properly connected to ground potential (PE rail). Ground connections must be established even when testing or operating the drive system for a short time!

Before switching on the device, all parts that carry voltage must be securely covered. During operation, all covers and control cabinet doors must remain closed.

Danger!

If the safety functions integrated in the drive system are used in an application, then they must be fully validated before the drive system is switched on for the first time. This could lead to death, severe injury or damage to property.

Control and power connections can still carry voltage even if the motor is not turning. Touching these connections while the device is switched on is prohibited.

Before performing any work on drive systems, they must first be disconnected from the power system and prevented from being switched on again.

Danger!

Dangerously high voltage!

Before performing service work, disconnect the power supply and wait 5 minutes to ensure that the capacitors have discharged. Observe regulations!

This delay time of 5 minutes begins as soon as all of the synchronous motors connected to the drive system that has been disconnected from the power supply have come to a standstill. If the synchronous motors are not stationary when the drive system is disconnected from the power supply, then the delay time must be extended accordingly.

SafeMOTION modules are labeled with the following warning:

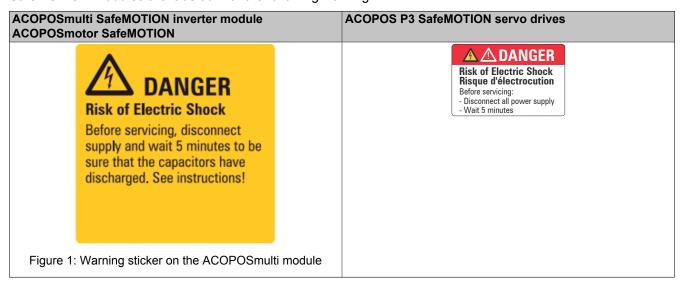

Table 8: Warning sticker on SafeMOTION modules

The connections on the drive system for signal voltages in the voltage range 5 to 30 V are safely isolated circuits. The signal voltage connections and interfaces are therefore only permitted to be connected to devices or electrical components that have sufficient isolation per EN 61800-5-1 and protective extra-low voltage that corresponds to voltage class DVC A (SELV, PELV).

Never remove the electrical connections of drive systems while voltage is applied. In the worst case, arcs may occur that can subsequently cause personal injury and/or damage to contacts.

2.9.2 Protection against hazardous movements

Danger!

Improper control of motors can result in unintended hazardous movements! Such incorrect behavior can have various causes:

- Incorrect installation or faults when handling components
- Improper or incomplete wiring
- Defective devices (drive system, motor, position encoder, cables, brake)
- Incorrect control (e.g. caused by software error)

Some of the errors listed above can be detected and prevented by the drive system's internal monitoring. Nevertheless, it is still possible for the motor shaft to move any time after the device is switched on! For this reason, higher-level safety precautions need to be put in place to ensure that personnel and machines are protected.

The moving parts on machines must be shielded in such a way as to prevent unintentional access by personnel. This type of protection can be achieved by using stable mechanical protective equipment such as protective covers, protective fences, protective gates or photoelectric sensors.

Removing, bypassing or circumventing these protective measures and entering the area where movement takes place is prohibited.

A sufficient number of emergency stop buttons must be installed in direct proximity to the machine and be easily accessible at all times. This emergency stop equipment must be checked before the machine is put into operation.

On free running motors, the key (if present) must be removed or measures taken to prevent its ejection. The holding brake built into motors cannot prevent hoisting equipment from dropping hanging loads.

2.10 Functional safety data and specifications

For the characteristic values of individual safety functions, see 3 "Safety characteristics of integrated safety functions" on page 313.

Characteristic values are calculated based on a proof test interval of maximum 20 years. Since a proof test cannot be carried out for B&R drive systems, the proof test interval is the same as the system's mission time.

In accordance with the EN ISO 13849, EN 62061 and IEC 61508 standards, the safety functions described in 6 "Safety technology" on page 279 cannot be used beyond the specified mission time.

Danger!

Operating SafeMOTION modules beyond the specified mission time is not permitted!

The user must ensure that all SafeMOTION modules are replaced by new SafeMOTION modules or removed from operation <u>before</u> their mission time expires.

Information:

The end date of the mission time (MTE) is stored on all modules of B&R drive systems that perform a safety function and can be read out by the user as follows (for details, see Automation Help):

- Parameter ID 10312 EPROM_MISSION_TIME_END
- Library ACP10_MC Function block MC_BR_GetHardwareInfo

The end date of the mission time (MTE) can also be read directly from the housing of modules:

• MTE: YYYYMMDD (YYYY ... Year, MM ... Month, DD ... Day)

3 Environmentally friendly disposal

All B&R drive systems and servo motors are designed to inflict as little harm as possible on the environment.

3.1 Separation of materials

It is necessary to separate out the different materials so that devices can undergo an environmentally friendly recycling process.

General information • Security concept

Component	Disposal
Drive systems, servo motors, cables	Electronic recycling
Cardboard/Paper packaging	Paper/Cardboard recycling

Table 9: Environmentally friendly separation of materials

Disposal must take place per applicable legal regulations.

4 Security concept

B&R products communicate via a network interface and were developed for integration into a secure network. The network and B&R products are affected by the following hazards (not a complete list):

- · Unauthorized access
- Digital intrusion
- · Data leakage
- · Data theft
- · A variety of other types of IT security breaches

It is the responsibility of the operator to provide and maintain a secure connection between B&R products and the internal network as well as other networks, such as the Internet, if necessary. The following measures and security solutions are suitable for this purpose:

- Segmentation of the network (e.g. separation of the IT and OT networks)
- · Firewalls for the secure connection of network segments
- · Implementation of a security-optimized user account and password concept
- · Intrusion prevention and authentication systems
- Endpoint security solutions with modules for anti-malware, data leakage prevention, etc.
- Data encryption

It is the responsibility of the operator to take appropriate measures and to implement effective security solutions.

B&R Industrial Automation GmbH and its subsidiaries are not liable for damages and/or losses resulting from, for example, IT security breaches, unauthorized access, digital intrusion, data leakage and/or data theft.

Before B&R releases products or updates, they are subjected to appropriate functional testing. Independently of this, the development of customized test processes is recommended in order to be able to check the effects of changes in advance. Such changes include, for example:

- · Installation of product updates
- Notable system modifications such as configuration changes
- Import of updates or patches for third-party software (non-B&R software)
- · Hardware replacement

These tests should ensure that implemented security measures remain effective and that systems behave as expected.

Chapter 2 • ACOPOSmulti SafeMOTION

1 Configuration of an ACOPOSmulti drive system

The ACOPOSmulti drive system consists of a mounting plate, various modules (power supply, auxiliary supply, inverter, expansion and capacitor modules), plug-in modules as well as a line filter and – only in combination with 8BVP active power supply modules – a regeneration choke.

There are 10 steps necessary to configure the ACOPOSmulti:

- 1. Determine the cooling method.
 - ° Standard cooling (wall mounting)
 - Feed-through cooling (feed-through mounting)
 - ° Oil/Water cooling (cold plate mounting)
- 2. Define or verify the supply voltage range and network configuration.
- 3. Select the ACOPOSmulti inverter modules according to the application requirements.
 - ° 1-axis modules
 - ° 2-axis modules
- 4. Select the ACOPOSmulti plug-in modules for the motor encoder and external axis encoder according to the application requirements.
- 5. Determine if it should be possible to extend the ACOPOSmulti drive system:

 If so, determine the number of optional slots on the mounting plate for other ACOPOSmulti modules
- Select ACOPOSmulti power supply modules according to the application requirements (active/passive power supply module) based on the total power of the ACOPOSmulti inverter modules needed (derating information must be taken into consideration if the supply voltage <3x 400 VAC)
 - Passive power supply modules¹⁾
 - Active power supply modules
- 7. Check the maximum chargeable DC bus capacitance.
- 8. Select the ACOPOSmulti auxiliary supply module based on the total power required for the 24 VDC supply of the selected ACOPOSmulti module, ACOPOSmulti plug-in modules as well as the peripheral supply (e.g. PLC, actuators, motor holding brakes, sensors)
 - ° 24 V internal
 - ° 24 V internal, 24 V external
 - 24 V internal, 24 V external, 24 V external supply
 - ° 42 V external

Danger!

ACOPOSmulti auxiliary supply modules (8B0C0320Hx00.00A-1) are not permitted to be used in combination with ACOPOSmulti SafeMOTION inverter modules!

- 9. Determine the total number of slots by adding the widths of all selected ACOPOSmulti modules (including optional slots).
- 10. Select the ACOPOSmulti mounting plate according to the total number of slots required and specified cooling method.

¹⁾ Step 8 can be skipped if the 24 VDC is supplied to the selected ACOPOSmulti inverter modules by passive power supply module 8B0P0110Hx00.000-1.

2 Status indicators

Status indicators are located on the black cover of each module.

2.1 8BVI SafeMOTION inverter modules

2.1.1 1-axis modules

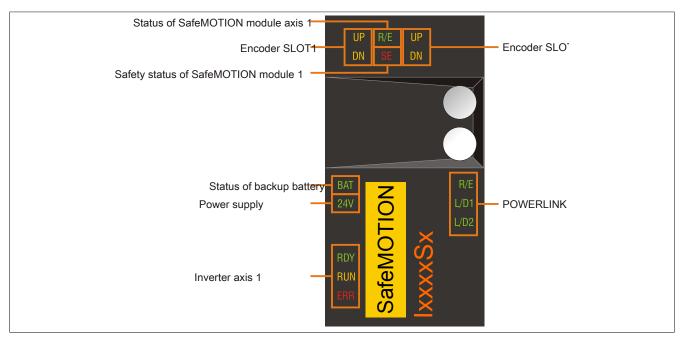

Figure 2: 8BVI SafeMOTION inverter modules (1-axis modules) - Status indicator groups

2.1.1.1 LED status indicators

Status indicator group	Label	Color	Function	Description
POWERLINK	R/E	Green/Red	Ready/Error	see "POWERLINK - LED status indicators" on
	L/D1	Green	Link/Data activity on port 1	page 32
	L/D2		Link/Data activity on port 2	
Inverter axis 1	RDY	Green	Ready	see "RDY, RUN, ERR (8BVI, 8BVP, 8B0P) - LED
	RUN	Orange	Run	status indicators" on page 32
	ERR	Red	Error	
Status of backup battery	BAT	Green/Red	Ready/Error	see "Backup battery (ACOPOSmulti SafeMOTION EnDat 2.2) - LED status indicators" on page 32
Power supply	24 V	Green	24 V OK	The 24 V module power supply voltage is within the tolerance range.
Encoder SLOT1	UP	Orange	Encoder direction of rotation +	Indicates that the position of the connected encoder is changing in the positive direction. The faster the encoder position changes, the brighter the LED is lit.
	DN		Encoder direction of rotation -	Indicates that the position of the connected encoder is changing in the negative direction. The faster the encoder position changes, the brighter the LED is lit.
Encoder SLOT2	UP	Orange	Encoder direction of rotation +	see Encoder SLOT1
	DN		Encoder direction of rotation -	
Status of SafeMOTION module axis 1	R/E	Green/Red	Ready/Error	see "SafeMOTION module - LED status indicators"
Safety status of SafeMOTION module 1	SE	Red	Safe/Error	on page 33

	L/D1	Green	Link/Data activity on port 1	page 32
	L/D2		Link/Data activity on port 2	
Inverter axis 1	RDY	Green	Ready	see "RDY, RUN, ERR (8BVI, 8BVP, 8B0P) - LED
	RUN	Orange	Run	status indicators" on page 32
	ERR	Red	Error	
Inverter axis 2	RDY	Green	Ready	See inverter axis 1
	RUN	Orange	Run	
	ERR	Red	Error	
Status of backup battery	BAT	Green/Red	Ready/Error	see "Backup battery (ACOPOSmulti SafeMOTION
				EnDat 2.2) - LED status indicators" on page 32
Power supply	24 V	Green	24 V OK	The 24 V module power supply voltage is within the tolerance range.
Encoder SLOT1	UP	Orange	Encoder direction of rotation +	The encoder position of the connected encoder is changing in the positive direction. The faster the encoder position changes, the brighter the LED is lit.
	DN		Encoder direction of rotation -	The encoder position of the connected encoder is changing in the negative direction. The faster the encoder position changes, the brighter the LED is lit.
Encoder SLOT2	UP	Orange	Encoder direction of rotation +	See encoder SLOT1.
	DN	1	Encoder direction of rotation -	
Status of SafeMOTION module axis 1	R/E	Green/Red	Ready/Error	see "SafeMOTION module - LED status indicators"
Safety status of SafeMOTION module 1	SE	Red	Safe/Error	on page 33
Status of SafeMOTION module axis 2	R/E	Green/Red	Ready/Error	
Safety status of SafeMOTION module 2	SE	Red	Safe/Error	

Table 11: 8BVI SafeMOTION inverter modules (2-axis modules) - LED status indicators

SafeMOTION User's Manual V 4.6.1

2.1.3 RDY, RUN, ERR (8BVI, 8BVP, 8B0P) - LED status indicators

Label	Color	Function	Description	
RDY	Green	Ready	Solid green	The module is operational and the power stage can be enabled (operating system present and booted, no permanent or temporary errors).
			Blinking green 1)	The module is not ready for operation.
				Examples:
				No signal on one or both enable inputs
				DC bus voltage outside the tolerance range
				Overtemperature on the motor (temperature sensor)
				Motor feedback not connected or defective
				Motor temperature sensor not connected or defective
				Overtemperature on the module (IGBT junction, heat sink, etc.)
				Disturbance on network
RUN	Orange	Run	Solid orange	The module's power stage is enabled.
ERR	Red	Error	Solid red 1)	There is a permanent error on the module.
				Examples:
				Permanent overcurrent
				Invalid data in EPROM

Table 12: RDY, RUN, ERR (8BVI, 8BVP, 8B0P) - LED status indicators

2.1.4 POWERLINK - LED status indicators

Label	Color	Function	Description	
R/E	Green/Red	Ready/Error	LED off	The module is not supplied with power or network interface initialization has failed.
			Solid red	The POWERLINK node number of the module is 0.
			Blinking red/green	The client is in an error state (drops out of cyclic operation).
			Blinking green (1x)	The client detects a valid POWERLINK frame on the network.
			Blinking green (2x)	Cyclic operation on the network is taking place, but the client itself is not yet a participant.
			Blinking green (3x)	Cyclic operation of the client is in preparation.
			Solid green	The client is participating in cyclic operation.
			Flickering green	The client is not participating in cyclic operation and also does not detect any other stations on the network participating in cyclic operation.
L/D1	Green	Link/Data activity or	Solid green	A physical connection has been established to another station on the network.
		port 1	Blinking green	Activity on port 1
L/D2	Green	Link/Data activity or	Solid green	A physical connection has been established to another station on the network.
		port 2	Blinking green	Activity on port 2

Table 13: POWERLINK - LED status indicators

2.1.5 Backup battery (ACOPOSmulti SafeMOTION EnDat 2.2) - LED status indicators

Label	Color	Function	Description	
BAT	Green/Red	Ready/Error	LED off	Possible causes:
				The voltage of the installed backup battery is within the tolerance range, but an EnDat encoder with backup battery is not connected.
				A battery-backed EnDat encoder is connected and registering "Battery OK", but the module's firmware version does not support EnDat encoders with battery backup.
			Solid green	A battery-backed EnDat encoder is connected and registering "Battery OK" (voltage of the installed backup battery is within the tolerance range).
			Solid red	A battery-backed EnDat encoder is connected and registering "Battery not OK".
				Possible causes:
				Voltage of the installed backup battery outside of tolerance range
				No backup battery installed in module

Table 14: Backup battery - LED status indicators

¹⁾ Firmware V2.130 and later.

2.1.6 SafeMOTION module - LED status indicators

There are 3 additional LEDs for each safe axis behind the front cover of an ACOPOSmulti SafeMOTION inverter module:

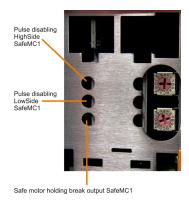

Figure 4: 1-axis modules

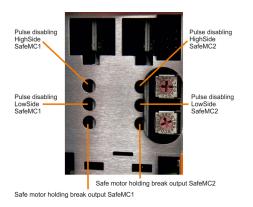

Figure 5: 2-axis modules

LED	Color		Description		
R/E	Green	Red			
	Off	Off	Module not supplied with power, no communication		
	Single flash		Mode "Unlink"		
	Double flash		Updating the firmware		
	Blinking		Mode PREOPERATIONAL		
	On		Mode RUN		
	On	Single flash, inverse	Safety-related firmware invalid		
		Triple flash, inverse	Updating safety-related firmware		
		On	Communication error		
	Off	On	Error		
LED status indicator Pulse disabling output, high-side	Red		Warning/Error on the channel During the startup phase, the channel LEDs are always lit con- stantly red.		
	Orange		24 V on the output		
	Off		0 V on the output		
LED status indicator Pulse disabling output, low-side	Red		Warning/Error on the channel During the startup phase, the channel LEDs are always lit con- stantly red.		
	Orange		24 V on the output		
	Off		0 V on the output		
LED status indicator Motor holding brake output	Red		Warning/Error on the channel During the startup phase, the channel LEDs are always lit con- stantly red.		
	Orange		24 V on the output		
	Off		0 V on the output		
SE	Red	Off	Mode RUN		
		On On	Boot phase or defective processor Safety preoperational state Safe communication channel not OK Boot phase Invalid firmware Non-acknowledgeable error state, FAIL SAFE state		
	The two "SE" indicators are two separate LEDs that show the states of safety processor 1 and safety processor 2. This is only distinguishan				
	when the front cover is or	when the front cover is open, however.			

Table 15: SafeMOTION module - LED status indicators

Danger!

Constantly lit "SE" LEDs indicate a non-acknowledgeable FAIL SAFE state. The cause of this could be a defective module or faulty configuration.

Check the entries in the logbook! If you are able to rule out a faulty configuration, then the module is defective and must be replaced immediately.

It is your responsibility to ensure that all necessary repair measures or corrections to the configuration are initiated after an error occurs since subsequent errors can result in dangerous situations!

2.1.7 Status changes when starting up the operating system loader

The following intervals are used for the LED status indicators:

SafeMOTION User's Manual V 4.6.1

Width of box: 50 ms Repeats after: 3,000 ms

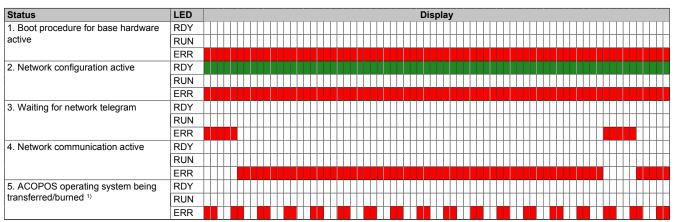

Table 16: Status changes when starting up the operating system loader

1) Firmware V2.140 and later.

2.1.8 Setting the POWERLINK node number

The POWERLINK node number can be set using the two coded hexadecimal rotary switches located behind the black cover.

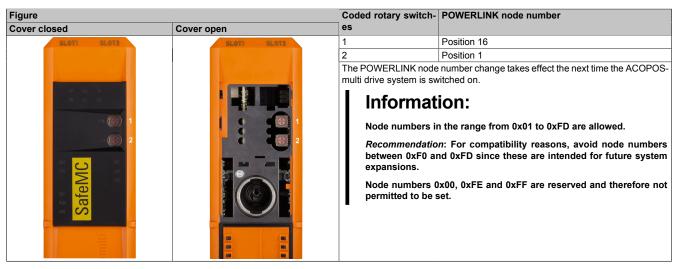

Table 17: Setting the POWERLINK node number

3 Data sheets

3.2 Safe single-width inverter modules (1-axis modules)

3.2.1 8BVI0014HCSS.000-1, 8BVI0014HWSS.000-1, 8BVI0014HCSA.000-1, 8BVI0014HWSA.000-1

3.2.1.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.2.1.2 Order data

Table 19: 8BVI0014HCSS.000-1, 8BVI0014HWSS.000-1, 8BVI0014HCSA.000-1, 8BVI0014HWSA.000-1 - Technical data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) I_M ... Current on motor connection X5A [A_{eff}]
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 6) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 14) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 15) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 16) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 17) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 18) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 19) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 20) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

 $I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$

- $I_{\mbox{\scriptsize G}}$... Max. current consumption of the encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ... Specific resistance [Ω mm²/m] (e.g. for copper: $\rho = 0.0178$)
- 21) The maximum permissible cable length is 50 m.

- 22) During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 23) An actual reserve of 12 mA exists for the terminating resistor.
- 24) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length z = 2 √((Sin - nSin)² + (Cos - nCos)²) is monitored according to the specified limits.
- 25) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.

 The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 26) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is permitted to deviate by a maximum of ±10% per signal period.
- This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 28) Limited by the encoder in practice.
- 29) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 30) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 31) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 32) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 33) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.2.1.4 Wiring

For details, see section 3.2.5 "Wiring: Safe single-width inverter modules (1-axis modules)" on page 58. For general information, see section 6 "Wiring" on page 150.

3.2.2 8BVI0028HCSS.000-1, 8BVI0028HWSS.000-1, 8BVI0028HCSA.000-1, 8BVI0028HWSA.000-1

3.2.2.1 General information

- Clearly structured, straightforward implementation via network-based safety technology
- Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.2.2.2 Order data

Model number	Short description
	Cold plate or feed-through mounting
8BVI0028HCSS.000-1	ACOPOSmulti SafeMOTION EnDat 2.2 inverter module, 3.8 A, HV, cold plate or feed-through mounting
8BVI0028HCSA.000-1	ACOPOSmulti SafeMOTION SinCos inverter module, 3.8 A, HV, cold plate or feed-through mounting

ACOPOSmulti SafeMOTION EnDat 2.2

Information:

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

ACOPOSmulti SafeMOTION SinCos

Information:

Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

Information:

Only 8BCS encoder cables from B&R are permitted to be connected to the encoder interfaces on B&R standard motors.

For details, see 1.2 "Safe power transmission system" on page 280.

Table 21: 8BVI0028HCSS.000-1, 8BVI0028HWSS.000-1, 8BVI0028HCSA.000-1, 8BVI0028HWSA.000-1 - Technical data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) SLOT 2 is not occupied. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 3) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 4) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 5) I_M ... Current on motor connection X5A [A_{eff}]
- 6) P_{SMC1} ... Max. power consumption P_{SMC}[W] of the SafeMOTION module in SLOT1 (see section "Encoder interfaces"). P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module). P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section). P_{SLOT2} ... Max. power consumption P_{SBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module). P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 8) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 9) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.

- 10) Value for the nominal switching frequency.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 12) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 13) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 14) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 15) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 16) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 17) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 18) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (Power unit: Limit speed exceeded).
- 19) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 20) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 21) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 22) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 23) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 24) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 25) The maximum encoder cable length I_{Max} can be calculated as follows (the maximum permissible encoder cable length of 100 m must not be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_{G} ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm2].
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178).
- 26) The maximum permissible cable length is 50 m.
- 27) During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 28) An actual reserve of 12 mA exists for the terminating resistor.
- 29) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is monitored according to the specified limits.
- 30) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2\sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 31) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
- The pointer length $z = 2 \sqrt{((\sin n\sin)^2 + (\cos n\cos)^2)}$ is permitted to deviate by a maximum of ±10% per signal period.

 32) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 33) Limited by the encoder in practice.
- 34) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 35) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration)
- 36) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 37) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 38) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.2.2.4 Wiring

For details, see section 3.2.5 "Wiring: Safe single-width inverter modules (1-axis modules)" on page 58.

For general information, see section 6 "Wiring" on page 150.

3.2.3 8BVI0055HCSS.000-1, 8BVI0055HWSS.000-1, 8BVI0055HCSA.000-1, 8BVI0055HWSA.000-1

3.2.3.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.2.3.2 Order data

Model number	Short description
	Cold plate or feed-through mounting
8BVI0055HCSS.000-1	ACOPOSmulti SafeMOTION EnDat 2.2 inverter module, 7.6 A,
	HV, cold plate or feed-through mounting

Table 23: 8BVI0055HCSS.000-1, 8BVI0055HWSS.000-1, 8BVI0055HCSA.000-1, 8BVI0055HWSA.000-1 - Technical data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) I_M ... Current on motor connection X5A [A_{eff}]
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 6) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{8BAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - $P_{24 \vee Out}$... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 15) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 18) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 19) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 20) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!

21) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 22) The maximum permissible cable length is 50 m.
- 23) During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 24) An actual reserve of 12 mA exists for the terminating resistor.
- 25) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2\sqrt{((\sin n\sin)^2 + (\cos n\cos)^2)}$ is monitored according to the specified limits.
- 26) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.

 The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 27) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is permitted to deviate by a maximum of ±10% per signal period.
- 28) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 29) Limited by the encoder in practice.
- 30) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 31) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 32) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 33) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 34) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.2.3.4 Wiring

For details, see section 3.2.5 "Wiring: Safe single-width inverter modules (1-axis modules)" on page 58.

For general information, see section 6 "Wiring" on page 150.

3.2.4 8BVI0110HCSS.000-1, 8BVI0110HWSS.000-1, 8BVI0110HCSA.000-1, 8BVI0110HWSA.000-1

3.2.4.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- · Easy implementation with transparent control and status information, even in the standard application
- · Compact design

Table 25: 8BVI0110HCSS.000-1, 8BVI0110HWSS.000-1, 8BVI0110HCSA.000-1, 8BVI0110HWSA.000-1 - Technical data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.</p>
- 4) I_{M} ... Current on motor connection X5A [A_{eff}]
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - $P_{\text{SLOT2}} \dots \text{Max. power consumption } P_{\text{BBAC}} \text{ [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module)}. \\$
 - $P_{24\,V\,Out}\,...\,Power\,[W]\,that\,is\,output\,to\,connections\,X2/+24\,V\,Out\,1\,\,and\,X2/+24\,V\,Out\,2\,on\,the\,module\,(max.\,10\,W).$

- 6) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 15) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 18) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 19) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 20) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 21) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

 $I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$

- I_{G} ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 22) The maximum permissible cable length is 50 m.
- 23) During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 24) An actual reserve of 12 mA exists for the terminating resistor.
- 25) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is monitored according to the specified limits.
- 26) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.

 The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 27) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is permitted to deviate by a maximum of $\pm 10\%$ per signal period.
- 28) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 29) Limited by the encoder in practice.
- 30) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 31) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 32) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 33) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 34) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.2.4.4 Wiring

For details, see section 3.2.5 "Wiring: Safe single-width inverter modules (1-axis modules)" on page 58.

For general information, see section 6 "Wiring" on page 150.

3.2.5 Wiring: Safe single-width inverter modules (1-axis modules)

3.2.5.1 ACOPOSmulti SafeMOTION EnDat 2.2 - Pinout overview

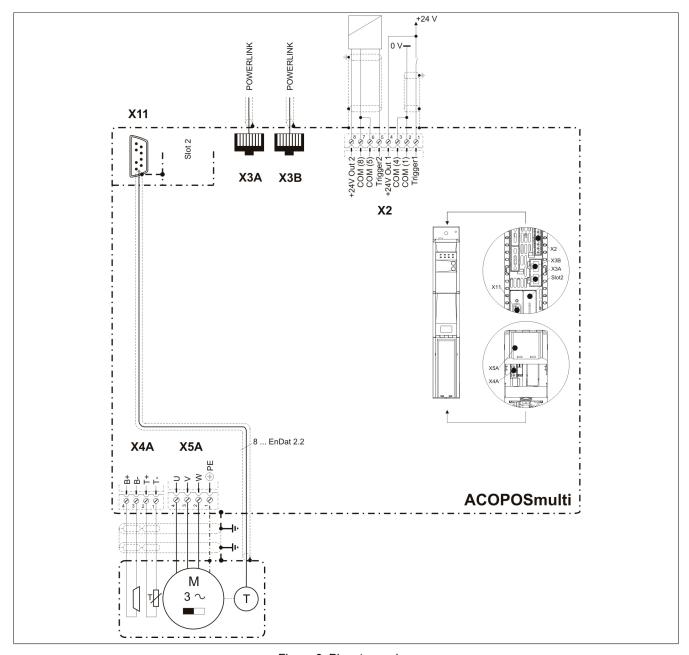

Figure 6: Pinout overview

3.2.5.2 ACOPOSmulti SafeMOTION SinCos - Pinout overview

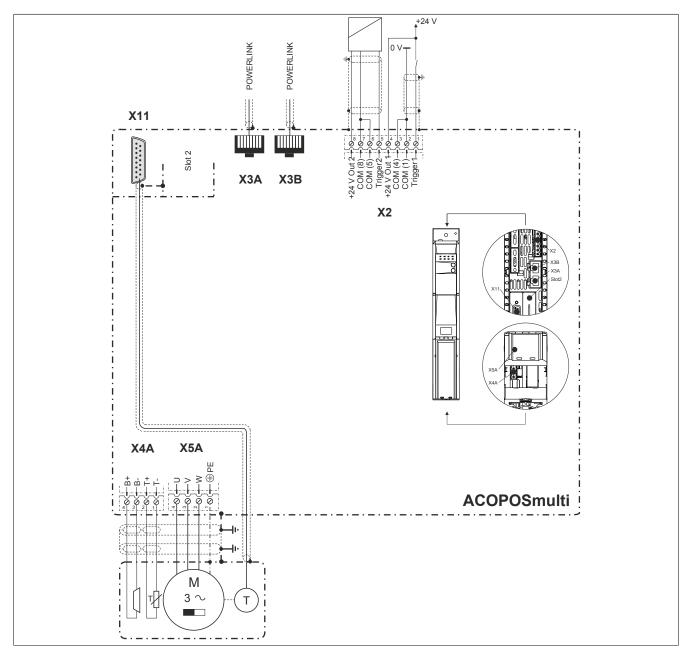

Figure 7: Pinout overview

3.2.5.3 Connector X2 - Pinout

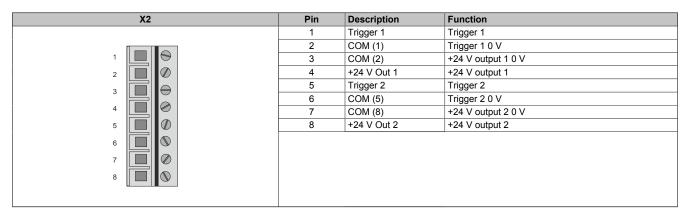

Table 26: Connector X2 - Pinout

3.2.5.4 Connectors X3A, X3B - Pinout

X3A, X3B	Pin	Description	Function
	1	RXD	Receive signal
	2	RXD\	Receive signal inverted
	3	TXD	Transmit signal
	4	Shield	Shield
	5	Shield	Shield
	6	TXD\	Transmit signal inverted
	7	Shield	Shield
	8	Shield	Shield

Table 27: X3A, X3B connectors - Pinout

3.2.5.5 X4A connector - Pinout

X4A	Description	Function
	T-	Axis 1: Temperature sensor -
	T+	Axis 1: Temperature sensor +
	B-	Axis 1: Brake -
	B+	Axis 1: Brake +
B+ B- T+ T-		

Table 28: Connector X4A - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of \leq 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 µs.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4A/T+ and X4A/T- connectors on an ACOPOSmulti module under the following conditions:

• SLOT1 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

3.2.5.6 X5A connector - Pinout

X5A	Description	Function
	(Axis 1: Protective ground conductor
	W	Axis 1: Motor connection W
	V	Axis 1: Motor connection V
	U	Axis 1: Motor connection U
□ V W ⊕		

Table 29: Connector X5A - Pinout

Information:

An additional PE wire does not have to be connected to the threaded bolt beside the X5A connector. The PE connection on the male X5A connector is required and sufficient.

ACOPOSmulti SafeMOTION EnDat 2.2

Information:

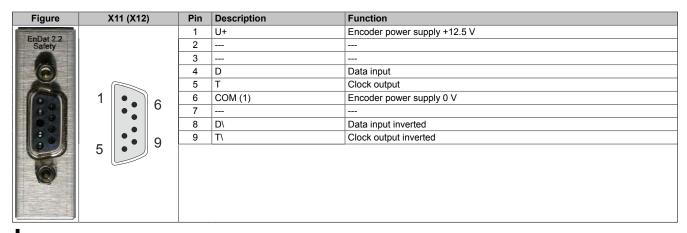

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

ACOPOSmulti SafeMOTION SinCos

Information:

Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

3.2.5.7 SafeMOTION EnDat 2.2 module - Pinout

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

Information:

The SafeMOTION module cannot be replaced! The SafeMOTION module and the ACOPOSmulti SafeMOTION inverter module together form a single unit. In the event of an error, the entire module must be replaced.

3.2.5.8 SafeMOTION SinCos module - Pinout

Figure	X11	Pin	Name	Function
		1	A	Channel A/Sin

RS422		14	R	Reference pulse/REF
		15	T\	Clock cycle inverted

Information:

The SafeMOTION module cannot be replaced! The SafeMOTION module and the ACOPOSmulti SafeMOTION inverter module together form a single unit. In the event of an error, the entire module must be replaced.

3.3 Safe double-width inverter modules (1-axis modules)

3.3.1 8BVI0220HCSS.000-1, 8BVI0220HWSS.000-1, 8BVI0220HCSA.000-1, 8BVI0220HWSA.000-1

3.3.1.1 General information

- Clearly structured, straightforward implementation via network-based safety technology
- Modular expandability through virtual wiring
- · Immediate triggering of safety function due to short cycle times
- · Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.3.1.2 Order data

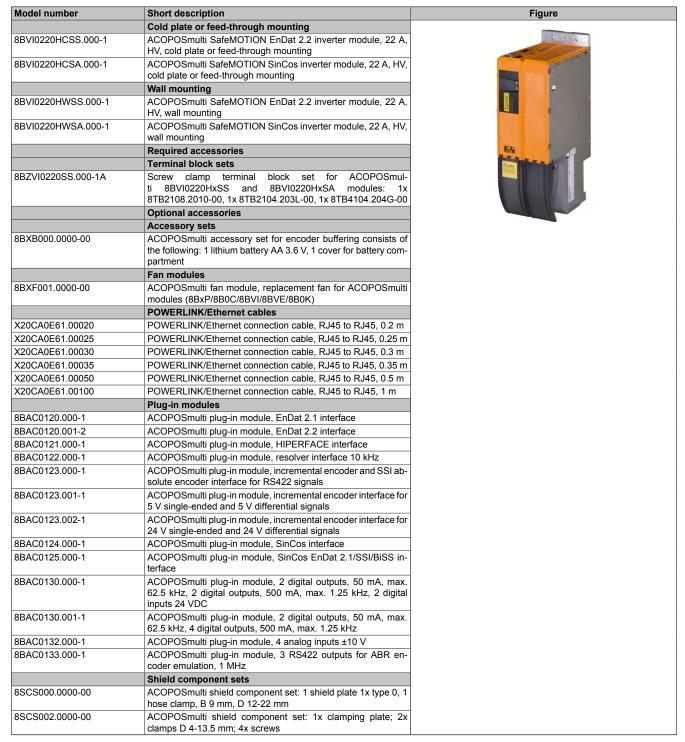

Table 30: 8BVI0220HCSS.000-1, 8BVI0220HCSA.000-1, 8BVI0220HWSS.000-1, 8BVI0220HWSA.000-1 - Order data

Model number	Short description

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) SLOT 2 is not occupied. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 3) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 4) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 5) I_{M} ... Current on motor connection X5A [A_{eff}]
- 6) P_{SMC1}... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 8) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 9) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 10) Value for the nominal switching frequency.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 12) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 13) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 14) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 15) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 16) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 17) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 18) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (power unit: limit speed exceeded).
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.

- 20) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 21) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 22) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 24) The maximum encoder cable length I_{Max} can be calculated as follows (the maximum permissible encoder cable length of 100 m must not be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²].
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178).
- 25) The maximum permissible cable length is 50 m.
- 26) During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 27) An actual reserve of 12 mA exists for the terminating resistor.
- 28) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is monitored according to the specified limits.
- 29) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 30) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is permitted to deviate by a maximum of $\pm 10\%$ per signal period.
- 31) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 32) Limited by the encoder in practice.
- 33) $I_{Encoder}$... Max. power consumption of the connected encoder [A].
- 34) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 35) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 36) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 37) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.3.1.4 Wiring

For details, see section 3.3.4 "Wiring: Safe double-width inverter modules (1-axis modules)" on page 81.

For general information, see section 6 "Wiring" on page 150.

3.3.2 8BVI0330HCSS.000-1, 8BVI0330HWSS.000-1, 8BVI0330HCSA.000-1, 8BVI0330HWSA.000-1

3.3.2.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- Modular expandability through virtual wiring
- · Immediate triggering of safety function due to short cycle times
- · Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.3.2.2 Order data

ACOPOSmulti SafeMOTION EnDat 2.2

Information:

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

ACOPOSmulti SafeMOTION SinCos

Information:

Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

Information:

Only 8BCS encoder cables from B&R are permitted to be connected to the encoder interfaces on B&R standard motors.

For details, see 1.2 "Safe power transmission system" on page 280.

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) SLOT 2 is not occupied. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 3) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 4) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 5) I_{M} ... Current on motor connection X5A [A_{eff}]
- 6) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 8) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 9) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 10) Value for the nominal switching frequency.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 12) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 13) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 14) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 15) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 16) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 17) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 18) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (power unit: limit speed exceeded).
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 20) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 21) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 22) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Q mm²/m] (e.g. for copper: ρ = 0.0178)

24) The maximum encoder cable length I_{Max} can be calculated as follows (the maximum permissible encoder cable length of 100 m must not be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178).
- 25) The maximum permissible cable length is 50 m.
- During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 27) An actual reserve of 12 mA exists for the terminating resistor.
- 28) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2\sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is monitored according to the specified limits.
- 29) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.

 The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 30) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is permitted to deviate by a maximum of ±10% per signal period.
- 31) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 32) Limited by the encoder in practice.
- 33) $I_{Encoder}$... Max. power consumption of the connected encoder [A].
- 34) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 35) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 36) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 37) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.3.2.4 Wiring

For details, see section 3.3.4 "Wiring: Safe double-width inverter modules (1-axis modules)" on page 81.

For general information, see section 6 "Wiring" on page 150.

3.3.3 8BVI0440HCSS.000-1, 8BVI0440HWSS.000-1, 8BVI0440HCSA.000-1, 8BVI0440HWSA.000-1

3.3.3.1 General information

- Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- · Immediate triggering of safety function due to short cycle times
- · Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.3.3.2 Order data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) SLOT 2 is not occupied. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 3) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 4) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 5) I_M ... Current on motor connection X5A [A_{eff}]
- 6) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 8) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 9) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 10) Value for the nominal switching frequency.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 12) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 13) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 14) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 15) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 16) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 17) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 18) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (power unit: limit speed exceeded).
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 20) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 21) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 22) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):
 - $I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$
 - I_G ... Max. current consumption of the encoder [A].
 - A ... Cross section of the power supply wires [mm²]
 - ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- The maximum encoder cable length I_{Max} can be calculated as follows (the maximum permissible encoder cable length of 100 m must not be exceeded):
 - $I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$
 - I_G ... Max. current consumption of the encoder [A].
 - A ... Cross section of the power supply wires [mm²].
 - ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178).
- 25) The maximum permissible cable length is 50 m.
- During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 27) An actual reserve of 12 mA exists for the terminating resistor.
- 28) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is monitored according to the specified limits.

- 29) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.

 The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 30) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is permitted to deviate by a maximum of ±10% per signal period.
- 31) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 32) Limited by the encoder in practice.
- 33) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 34) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 35) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 36) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 37) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.3.3.4 Wiring

For details, see section 3.3.4 "Wiring: Safe double-width inverter modules (1-axis modules)" on page 81.

For general information, see section 6 "Wiring" on page 150.

3.3.4 Wiring: Safe double-width inverter modules (1-axis modules)

3.3.4.1 ACOPOSmulti SafeMOTION EnDat 2.2 - Pinout overview

3.3.4.5 X4A connector - Pinout

X4A	Description	Function
	T-	Axis 1: Temperature sensor -
	T+	Axis 1: Temperature sensor +
	B-	Axis 1: Brake -
	B+	Axis 1: Brake +
B+ B- T+ T-		

Table 38: Connector X4A - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of \leq 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 µs.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4A/T+ and X4A/T- connectors on an ACOPOSmulti module under the following conditions:

• SLOT1 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

3.3.4.6 X5A connector - Pinout

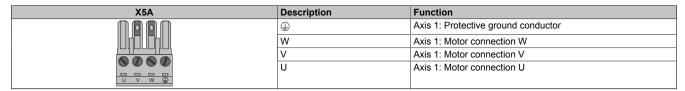

Table 39: Connector X5A - Pinout

Information:

An additional PE wire does not have to be connected to the threaded bolt beside the X5A connector. The PE connection on the male X5A connector is required and sufficient.

ACOPOSmulti SafeMOTION EnDat 2.2

Information:

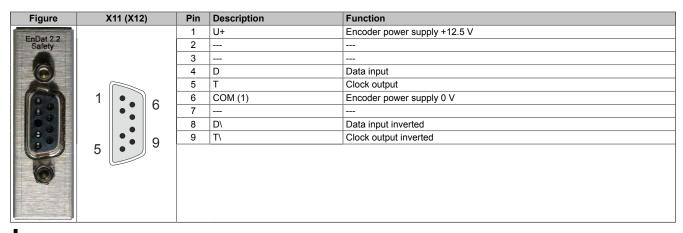

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

ACOPOSmulti SafeMOTION SinCos

Information:

Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

3.3.4.7 SafeMOTION EnDat 2.2 module - Pinout

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

Information:

The SafeMOTION module cannot be replaced! The SafeMOTION module and the ACOPOSmulti SafeMOTION inverter module together form a single unit. In the event of an error, the entire module must be replaced.

The SafeMOTION module cannot be replaced! The SafeMOTION module and the ACOPOSmulti SafeMOTION inverter module together form a single unit. In the event of an error, the entire module must be replaced.

3.4 Safe single-width inverter modules (2-axis modules)

3.4.1 8BVI0014HCDS.000-1, 8BVI0014HWDS.000-1

3.4.1.1 General information

- Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- · Immediate triggering of safety function due to short cycle times
- Easy implementation with transparent control and status information, even in the standard application
- · Compact design
- · Complete safety functionality, even in 2-axis modules

3.4.1.2 Order data

Model number	Short description
	Cold plate or feed-through mounting
8BVI0014HCDS.000-1	ACOPOSmulti SafeMOTION EnDat 2.2 inverter module, 1.9 A, HV, cold plate or feed-through mounting, 2 axes
	Wall mounting
8BVI0014HWDS.000-1	ACOPOSmulti SafeMOTION EnDat 2.2 inverter module, 1.9 A, HV, wall mounting, 2 axes
	Required accessories
	Terminal block sets
8BZVI0055DS.000-1A	Screw clamp set for ACOPOSmulti 8BVI00xxHxDS modules: 1x 8TB2108.2010-00, 1x 8TB2104.203L-00, 1x 8TB2104.203F-00, 1x 8TB3104.204G-11, 1x 8TB3104.204K-11
	Optional accessories

Table 41: 8BVI0014HCDS.000-1, 8BVI0014HWDS.000-1 - Technical data

- 1) SLOT 1 and SLOT 2 of the ACOPOSmulti module are occupied by the encoder interfaces.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) $I_M = 0.5 * (I_{X5A} + I_{X5B})$
 - $I_{\text{X5A}} \dots$ Current on X5A motor connection $[A_{\text{Eff}}]$
 - $I_{\text{X5B}} \dots$ Current on X5B motor connection [A $_{\text{Eff}}]$
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SMC2} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT2 (see the "Encoder interfaces" section).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- P_{SMC1} ... Max. power consumption P_{SMC}[W] of the SafeMOTION module in SLOT1 (see section "Encoder interfaces").
 P_{SMC2} ... Max. power consumption P_{SMC}[W] of the SafeMOTION module in SLOT2 (see section "Encoder interfaces").
 - $P_{24 \text{ VOut}}$... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid in the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load. When using 2-axis modules, the increased CPU load reduces the functionality of the drive; if this is not taken into consideration, the computing time can be exceeded in extreme cases.
- 14) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 15) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (Power unit: Limit speed exceeded).
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. The operating voltage range of the holding brake can be found in the user's manual for the respective motor.
- 18) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.

- 20) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 21) The maximum encoder cable length I_{Max} can be calculated as follows (the maximum permissible encoder cable length of 100 m must not be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²].
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178).
- 22) The maximum encoder cable length \bar{l}_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_{G} ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 23) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 24) Continuous operation at elevations ranging from 500 m to 4000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 25) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 26) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.4.1.4 Wiring

For details, see section 3.4.4 "Wiring: Safe single-width inverter modules (2-axis modules)" on page 99.

For general information, see section 6 "Wiring" on page 150.

3.4.2 8BVI0028HCDS.000-1, 8BVI0028HWDS.000-1

3.4.2.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- Easy implementation with transparent control and status information, even in the standard application
- Compact design
- Complete safety functionality, even in 2-axis modules

Table 43: 8BVI0028HCDS.000-1, 8BVI0028HWDS.000-1 - Technical data

- 1) SLOT 1 and SLOT 2 of the ACOPOSmulti module are occupied by the encoder interfaces.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) $I_M = 0.5 * (I_{X5A} + I_{X5B})$
 - $I_{\text{X5A}} \dots$ Current on motor connection X5A $[A_{\text{eff}}]$
 - I_{X5B} ... Current on motor connection X5B $[A_{\text{eff}}]$
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SMC2} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT2 (see the "Encoder interfaces" section).
 - $P_{24\,V\,Out}$... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).

- 6) P_{SMC1} ... Max. power consumption $P_{SMC}[W]$ of the SafeMOTION module in SLOT1 (see section "Encoder interfaces").
 - P_{SMC2} ... Max. power consumption P_{SMC}[W] of the SafeMOTION module in SLOT2 (see section "Encoder interfaces").
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load. When using 2-axis modules, the increased CPU load reduces the functionality of the drive: if this is not taken into consideration, the computing time can be exceeded in extreme cases.
- 15) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 18) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 19) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 20) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 21) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 22) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

 $I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$

- I_G ... Max. current consumption of the encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 23) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 24) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 25) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 26) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

Table 45: 8BVI0055HCDS.000-1, 8BVI0055HWDS.000-1 - Technical data

- 1) SLOT 1 and SLOT 2 of the ACOPOSmulti module are occupied by the encoder interfaces.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) $I_M = 0.5 * (I_{X5A} + I_{X5B})$
 - I_{X5A} ... Current on X5A motor connection [A_{Eff}]
 - I_{X5B} ... Current on X5B motor connection [A_{Eff}]
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - $P_{\text{SMC2}} \dots \text{Max. power consumption } P_{\text{SMC}} [W] \text{ of the SafeMOTION module in SLOT2 (see the "Encoder interfaces" section)}.$
 - $P_{24 \text{ V Out}}$... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 6) P_{SMC1} ... Max. power consumption $P_{SMC}[W]$ of the SafeMOTION module in SLOT1 (see section "Encoder interfaces").
 - $P_{\text{SMC2}} \dots \text{Max. power consumption } P_{\text{SMC}}[W] \text{ of the SafeMOTION module in SLOT2 (see section "Encoder interfaces")}.$
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid in the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load. When using 2-axis modules, the increased CPU load reduces the functionality of the drive; if this is not taken into consideration, the computing time can be exceeded in extreme cases.
- 15) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (Power unit: Limit speed exceeded).
- 17) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 18) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. The operating voltage range of the holding brake can be found in the user's manual for the respective motor.
- 19) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 21) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 22) The maximum encoder cable length I_{Max} can be calculated as follows (the maximum permissible encoder cable length of 100 m must not be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²].
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178).

23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Q mm²/m] (e.g. for copper: ρ = 0.0178)
- 24) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 25) Continuous operation at elevations ranging from 500 m to 4000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 26) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 27) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.4.3.4 Wiring

For details, see section 3.4.4 "Wiring: Safe single-width inverter modules (2-axis modules)" on page 99.

For general information, see section 6 "Wiring" on page 150.

3.4.4 Wiring: Safe single-width inverter modules (2-axis modules)

3.4.4.1 Pinout overview

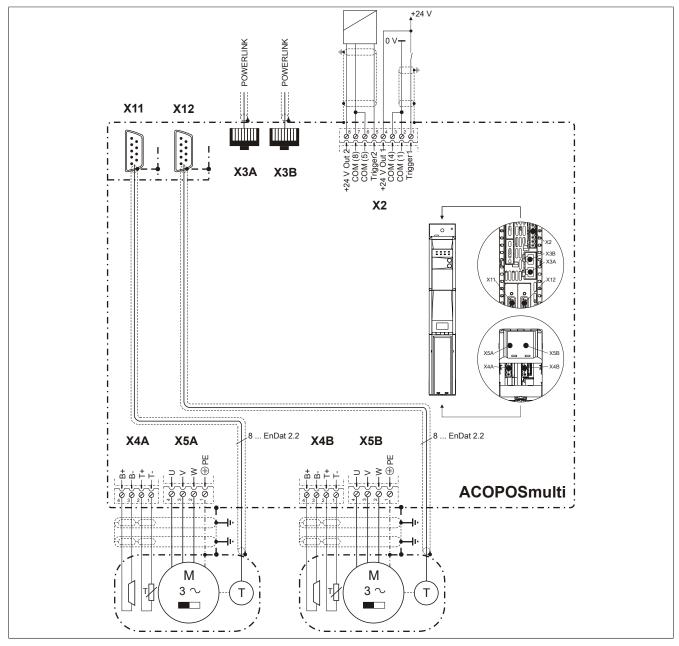

Figure 10: Pinout overview

3.4.4.2 Connector X2 - Pinout

	8	Shield	Shield

Table 47: X3A, X3B connectors - Pinout

3.4.4.4 Connector X4A - Pinout

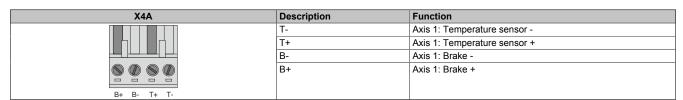

Table 48: Connector X4A - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

For a 2-axis module, it is therefore especially important to prevent a cross fault between the two B+connections of the two axes!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of ≤ 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 µs.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4A/T+ and X4A/T- connectors on an ACOPOSmulti module under the following conditions:

• SLOT1 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

3.4.4.5 Connector X4B - Pinout

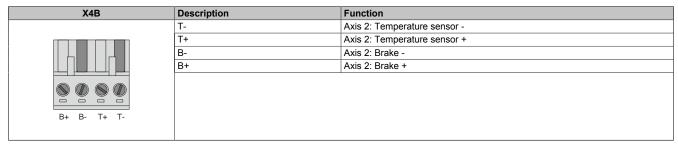

Table 49: Connector X4B - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

For a 2-axis module, it is therefore especially important to prevent a cross fault between the two B+ connections of the two axes!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of ≤ 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 µs.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4B/T+ and X4B/T- connectors on an ACOPOSmulti module under the following conditions:

SLOT2 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which
a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

3.4.4.6 Connector X5A - Pinout

X5A	Description	Function
	(b)	Axis 1: Protective ground conductor
	W	Axis 1: Motor connection W
	V	Axis 1: Motor connection V
	U	Axis 1: Motor connection U
U V W (1)		

Table 50: Connector X5A - Pinout

Information:

An additional PE wire does not have to be connected to the threaded bolt beside the X5A connector. The PE connection on the male X5A connector is required and sufficient.

Information:

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

3.4.4.7 Connector X5B - Pinout

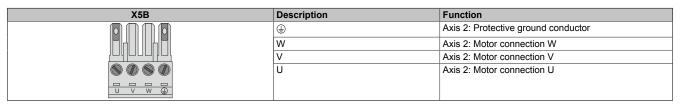

Table 51: Connector X5B - Pinout

Information:

Only B&R 8BCM motor cables are permitted to be used for wiring the motor connections!

3.4.4.8 SafeMOTION EnDat 2.2 module - Pinout

0 0		7		
0.5		8	D/	Data input inverted
	- 9	9	Τ\	Clock output inverted
	5		-	

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

Information:

The SafeMOTION module cannot be replaced! The SafeMOTION module and the ACOPOSmulti SafeMOTION inverter module together form a single unit. In the event of an error, the entire module must be replaced.

3.5 Safe double-width inverter modules (2-axis modules)

3.5.1 8BVI0110HCDS.000-1, 8BVI0110HWDS.000-1

3.5.1.1 General information

- Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- · Immediate triggering of safety function due to short cycle times
- Easy implementation with transparent control and status information, even in the standard application
- · Compact design
- · Complete safety functionality, even in 2-axis modules

3.5.1.2 Order data

Model number	Short description
	Cold plate or feed-through mounting
8BVI0110HCDS.000-1	ACOPOSmulti SafeMOTION EnDat 2.2 inverter module, 15.1 A, HV, cold plate or feed-through mounting, 2 axes
	Wall mounting
8BVI0110HWDS.000-1	ACOPOSmulti SafeMOTION EnDat 2.2 inverter module, 15.1 A, HV, wall mounting, 2 axes

Table 53: 8BVI0110HCDS.000-1, 8BVI0110HWDS.000-1 - Technical data

- 1) SLOT 1 and SLOT 2 of the ACOPOSmulti module are occupied by the encoder interfaces.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) $I_M = 0.5 * (I_{X5A} + I_{X5B})$
 - $I_{\text{X5A}} \dots$ Current on motor connection X5A $[A_{\text{eff}}]$
 - $I_{\text{X5B}} \dots$ Current on motor connection X5B $[A_{\text{eff}}]$
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - $P_{\text{SMC2}} ... \ \text{Max. power consumption } P_{\text{SMC}} \left[W \right] \text{ of the SafeMOTION module in SLOT2 (see the "Encoder interfaces" section)}.$
 - $P_{24\,V\,Out}\,...\,Power\,[W]\,that\,is\,output\,to\,connections\,X2/+24\,V\,Out\,1\,and\,X2/+24\,V\,Out\,2\,on\,the\,module\,(max.\,10\,W).$
- P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section). P_{SMC2} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT2 (see the "Encoder interfaces" section).
 - $P_{24 \text{ VOut}}$... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min). The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 12) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 13) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load. When using 2-axis modules, the increased CPU load reduces the functionality of the drive; if this is not taken into consideration, the computing time can be exceeded in extreme cases.
- 14) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 15) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (power unit: limit speed exceeded).
- 17) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.

- 18) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 19) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 20) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 21) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A]
- A ... Cross section of the power supply wires [mm2]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 22) The maximum encoder cable length I_{Max} can be calculated as follows (the maximum permissible encoder cable length of 100 m must not be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²].
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178).
- I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 24) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 25) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 26) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.5.1.4 Wiring

For details, see section 3.5.3 "Wiring: Safe double-width inverter modules (2-axis modules)" on page 113.

For general information, see section 6 "Wiring" on page 150.

3.5.2 8BVI0220HCDS.000-1, 8BVI0220HWDS.000-1

3.5.2.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- · Immediate triggering of safety function due to short cycle times
- · Easy implementation with transparent control and status information, even in the standard application
- Compact design
- · Complete safety functionality, even in 2-axis modules

 - I_{X5B} ... Current on motor connection X5B $[A_{\text{eff}}]$
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - $P_{\text{SMC2}} \dots \text{Max. power consumption } P_{\text{SMC}} [W] \text{ of the SafeMOTION module in SLOT2 (see the "Encoder interfaces" section)}.$
 - $P_{24\,V\,Out}\dots Power$ [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 6) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

ACOPOSmulti SafeMOTION • Data sheets

- 7) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min). The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 8) Value for the nominal switching frequency.
- 9) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 10) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 12) The thermal pulse load capacity is lower than for the 8BVI0220HxS0.000-1 1-axis module. It is therefore not possible to simply replace two 8BVI0220HxS0.000-1 1-axis modules with one 8BVI0220HxD0.000-1 2-axis module. If this is required, the load cycle must be examined in detail.
- 13) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load. When using 2-axis modules, the increased CPU load reduces the functionality of the drive; if this is not taken into consideration, the computing time can be exceeded in extreme cases.
- 14) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 15) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 16) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 17) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
- 18) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 19) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 20) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- $I_G \dots Max.$ current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 21) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 22) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 23) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 24) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.5.2.4 Wiring

For details, see section 3.5.3 "Wiring: Safe double-width inverter modules (2-axis modules)" on page 113.

For general information, see section 6 "Wiring" on page 150.

3.5.3 Wiring: Safe double-width inverter modules (2-axis modules)

3.5.3.1 ACOPOSmulti SafeMOTION EnDat 2.2 - Pinout overview

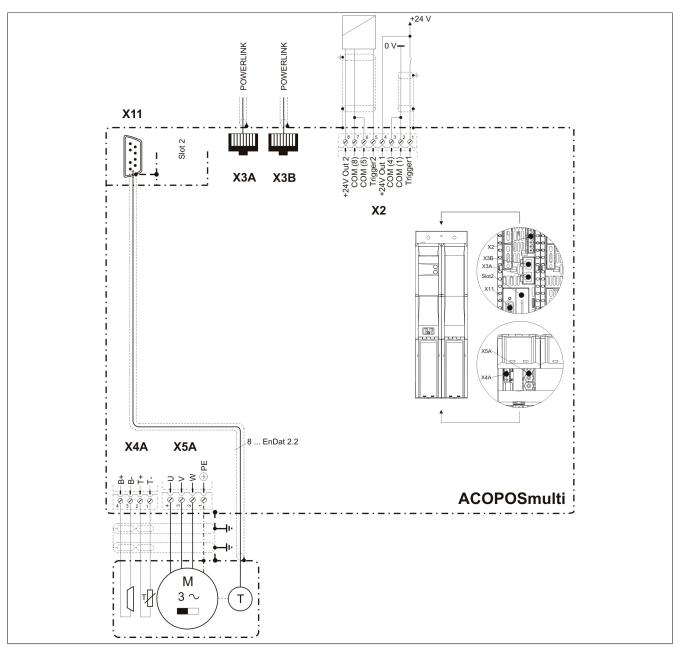

Figure 11: Pinout overview

3.5.3.2 Connector X2 - Pinout

3.5.3.4 Connector X4A - Pinout

X4A	Description	Function
	T-	Axis 1: Temperature sensor -
	T+	Axis 1: Temperature sensor +
	B-	Axis 1: Brake -
	B+	Axis 1: Brake +
B+ B- T+ T-		

Table 58: Connector X4A - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

For a 2-axis module, it is therefore especially important to prevent a cross fault between the two B+connections of the two axes!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of \leq 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 µs.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4A/T+ and X4A/T- connectors on an ACOPOSmulti module under the following conditions:

• SLOT1 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

3.5.3.5 Connector X4B - Pinout

X4B	Description	Function
	T-	Axis 2: Temperature sensor -
	T+	Axis 2: Temperature sensor +
	B-	Axis 2: Brake -
	B+	Axis 2: Brake +
B+ B- T+ T-		

Table 59: Connector X4B - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended! A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

For a 2-axis module, it is therefore especially important to prevent a cross fault between the two B+ connections of the two axes!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of ≤ 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 μ s.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4B/T+ and X4B/T- connectors on an ACOPOSmulti module under the following conditions:

• SLOT2 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

3.5.3.6 Connector X5A - Pinout

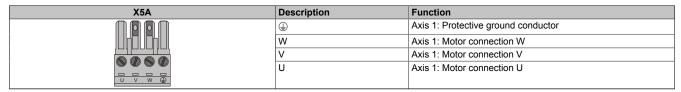

Table 60: Connector X5A - Pinout

Information:

An additional PE wire does not have to be connected to the threaded bolt beside the X5A connector. The PE connection on the male X5A connector is required and sufficient.

Information:

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

3.5.3.7 Connector X5B - Pinout

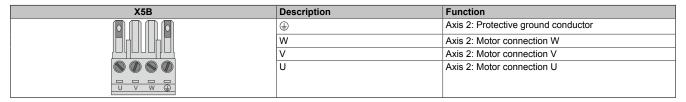

Table 61: Connector X5B - Pinout

Information:

Only B&R 8BCM motor cables are permitted to be used for wiring the motor connections!

3.5.3.8 SafeMOTION EnDat 2.2 module - Pinout

Figure	X11 (X12)	Pin	Description	Function

	' 6	7		
		8	D\	Data input inverted
1 6	_ • 9	9	Τ\	Clock output inverted
	5			

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

Information:

The SafeMOTION module cannot be replaced! The SafeMOTION module and the ACOPOSmulti SafeMOTION inverter module together form a single unit. In the event of an error, the entire module must be replaced.

3.6 Safe 4x width inverter modules (1-axis modules)

3.6.1 8BVI0660HCSS.000-1, 8BVI0660HWSS.000-1, 8BVI0660HCSA.000-1, 8BVI0660HWSA.000-1

3.6.1.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.6.1.2 Order data

Model number	Short description	Figure

Table 63: 8BVI0660HCSS.000-1, 8BVI0660HWSS.000-1, 8BVI0660HCSA.000-1, 8BVI0660HWSA.000-1 - Technical data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) I_M ... Current on motor connection X5A [A_{eff}]
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - $P_{\text{SLOT2}} \dots \text{Max. power consumption } P_{\text{BBAC}} \text{ [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module)}. \\$
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 6) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{8BAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 15) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) The connection is made with cable lugs for M8 (0.32") threaded bolts. The nominal cross section of the cable lug must match the cross section of the conductor that is to be connected in the particular application.
- 18) The maximum diameter that can be clamped depends on the shield component set.
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.

- 20) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - Connection between S1 and S2 (activation of the external holding brake) using a jumper with a max. length of 10 cm.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
 - If jumpers longer than 10 cm are used to connect S1 and S2, then the output voltage is reduced because of voltage drops on the jumpers.
- 21) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 22) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 24) The maximum permissible cable length is 50 m.
- 25) During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 26) An actual reserve of 12 mA exists for the terminating resistor.
- 27) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is monitored according to the specified limits.
- 28) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.

 The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 29) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is permitted to deviate by a maximum of ±10% per signal period.
- 30) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 31) Limited by the encoder in practice.
- 32) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 33) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 34) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 35) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 36) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.6.1.4 Wiring

For details, see section 3.6.3 "Wiring: Safe 4x width inverter modules (1-axis modules)" on page 130.

For general information, see section 6 "Wiring" on page 150.

3.6.2 8BVI0880HCSS.004-1, 8BVI0880HWSS.004-1, 8BVI0880HCSA.004-1, 8BVI0880HWSA.004-1

3.6.2.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- · Easy implementation with transparent control and status information, even in the standard application
- Compact design

Table 65: 8BVI0880HCSS.004-1, 8BVI0880HWSS.004-1, 8BVI0880HCSA.004-1, 8BVI0880HWSA.004-1 - Technical data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) I_M ... Current on motor connection X5A [A_{eff}]
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - PSLOT2 ... Max. power consumption PBBAC [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 6) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section).
 - P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).
 - P_{24 V Out} ... Power [W] that is output to the connections X2/+24 V Out 1 and X2/+24 V Out 2 on the module (max. 10 W).
- 7) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 8) Valid in the following conditions: 750 VDC DC bus voltage. The temperature specifications refer to the ambient temperature.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 11) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 12) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 13) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 15) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) The connection is made with cable lugs for M8 (0.32") threaded bolts. The nominal cross section of the cable lug must match the cross section of the conductor that is to be connected in the particular application.
- 18) The maximum diameter that can be clamped depends on the shield component set.
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 20) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - Connection between S1 and S2 (activation of the external holding brake) using a jumper with a max. length of 10 cm.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
 - If jumpers longer than 10 cm are used to connect S1 and S2, then the output voltage is reduced because of voltage drops on the jumpers.
- 21) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 22) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 24) The maximum permissible cable length is 50 m.

- 25) During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 26) An actual reserve of 12 mA exists for the terminating resistor.
- 27) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length $z = 2 \sqrt{((\sin n\sin)^2 + (\cos n\cos)^2)}$ is monitored according to the specified limits.
 - The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
- The pointer length z = 2 $\sqrt{((\text{Sin nSin})^2 + (\text{Cos nCos})^2)}$ is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 29) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is permitted to deviate by a maximum of ±10% per signal period.
- 30) This value does not correspond to the encoder resolution that must be configured in Automation Studio (16384 * number of encoder lines).
- 31) Limited by the encoder in practice.
- 32) I_{Encoder} ... Max. power consumption of the connected encoder [A].
- 33) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 34) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 35) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 36) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.6.2.4 Wiring

28)

For details, see section 3.6.3 "Wiring: Safe 4x width inverter modules (1-axis modules)" on page 130.

For general information, see section 6 "Wiring" on page 150.

	B+	Axis 1: Brake +
B+ B- T+ T-		

Table 68: Connector X4A - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of \leq 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 µs.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4A/T+ and X4A/T- connectors on an ACOPOSmulti module under the following conditions:

• SLOT1 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

3.6.3.6 X5A - Pinout

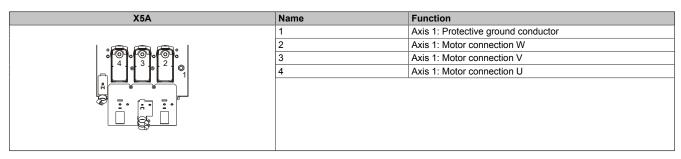

Table 69: X5A - Pinout

ACOPOSmulti SafeMOTION EnDat 2.2

Information:

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

ACOPOSmulti SafeMOTION SinCos

Information:

Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

3.7 Safe 8x width inverter modules (1-axis modules)

3.7.1 8BVI1650HCSS.000-1

3.7.1.1 General information

- · Clearly structured, straightforward implementation via network-based safety technology
- · Modular expandability through virtual wiring
- Immediate triggering of safety function due to short cycle times
- · Easy implementation with transparent control and status information, even in the standard application
- · Compact design

3.7.1.2 Order data

Model number	Short description	Figure
	Cold plate or feed-through mounting	_
8BVI1650HCSS.000-1	ACOPOSmulti SafeMOTION EnDat 2.2 inverter module, 165 A, HV, cold plate or feed-through mounting	
	Required accessories

Information:

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

For details, see 1.2 "Safe power transmission system" on page 280.

3.7.1.3 Technical data

Model number	8BVI1650HCSS.000-1	
General information		
B&R ID code	0xB878	
Cooling and mounting method	Cold plate or feed-through mounting	
Slots for plug-in modules	2 1)	
Certifications		
CE	Yes	
KC	Yes	
EAC	Yes	
UL	cULus E225616	
	Power conversion equipment	
Functional safety ²⁾	Yes (openSAFETY)	
DC bus connection		
Voltage		
Nominal	750 VDC	
Continuous power consumption 3)	121.8 kW	
Power dissipation depending on switching frequency 4)		
Switching frequency 5 kHz	$[0.001 * I_M^2 + 9.9 * I_M + 165] W$	
Switching frequency 10 kHz	$[0.17 * I_{M}^{2} + 10.8 * I_{M} + 320] W$	
Switching frequency 20 kHz	In preparation	
DC bus capacitance	3630 μF	
Variant	ACOPOSmulti backplane	
24 VDC power supply		
Input voltage	25 VDC ±1.6%	
Input capacitance	32.9 µF	
Max. power consumption	43 W + P _{SMC1} + P _{SLOT2} + P _{24 V Out} + P _{HoldingBrake} ⁵⁾	
Variant	ACOPOSmulti backplane	
24 VDC output		
Quantity	2	
Output voltage		
DC bus voltage (U _{DC}): 260 to 315 VDC	25 VDC * (U _{DC} /315)	
DC bus voltage (U _{DC}): 315 to 800 VDC	24 VDC ±6%	
Fuse protection	250 mA (slow-blow) electronic, automatic reset	
Motor connection 6)		
Quantity	1	
Continuous power per motor connection 3)	120 kW	
Continuous current per motor connection 3)	165 A _{eff}

Table 73: 8BVI1650HCSS.000-1 - Technical data

- 1) SLOT 2 is available. SLOT 1 of the ACOPOSmulti module is occupied by the SafeMOTION module.
- 2) Achievable safety classifications (safety integrity level, safety category, performance level) are documented in the user's manual (section "Safety technology").
- 3) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 4) I_{M} ... Current on motor connection X5A [A_{eff}]
- 5) P_{SMC1} ... Max. power consumption P_{SMC} [W] of the SafeMOTION module in SLOT1 (see the "Encoder interfaces" section). P_{SLOT2} ... Max. power consumption P_{BBAC} [W] of the plug-in module in SLOT2 (see the technical data for the respective plug-in module).

 $P_{24\,V\,Out}\,...\,Power\,[W]\,that\,is\,output\,to\,connections\,X2/+24\,V\,Out\,1\,and\,X2/+24\,V\,Out\,2\,on\,the\,module\,(max.\,10\,W).$

- 6) Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.
- 7) Valid for the following conditions: 750 VDC DC bus voltage, minimum permissible coolant flow volume (3 l/min).
- 8) The temperature specifications refer to the return temperature of the cold plate mounting plate.
- 9) Value for the nominal switching frequency.
- 10) The module cannot supply the full continuous current at this switching frequency. This unusual value for the return temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
 - Caution! Condensation can occur at low flow temperatures and return temperatures.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 12) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 13) If necessary, the stress of the motor isolation system can be reduced by an additional externally wired dv/dt choke. For example, the RWK 305 three-phase du/dt choke from Schaffner (www.schaffner.com) can be used. Important: Even when using a dv/dt choke, it is necessary to ensure that an EMC-compatible, low inductance shield connection is used!
- 14) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").

- 15) The connection is made with cable lugs for M8 (0.32") threaded bolts. The nominal cross section of the cable lug must match the cross section of the conductor that is to be connected in the particular application.
- 16) The maximum diameter that can be clamped depends on the shield component set.
- 17) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 18) The specified value is only valid under the following conditions:
 - The 24 VDC supply for the module is provided by an 8B0C auxiliary supply module installed on the same mounting plate.
 - Connection between S1 and S2 (activation of the external holding brake) using a jumper with a max. length of 10 cm.
 - If the 24 VDC supply for the module is applied to the mounting plate using an 8BVE expansion module, then the output voltage is reduced because of voltage drops on the expansion cable. In this case, undervoltage monitoring must be disabled.
 - If jumpers longer than 10 cm are used to connect S1 and S2, then the output voltage is reduced because of voltage drops on the jumpers.
- 19) Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.
- 20) An EnDat 2.2 functional safety encoder is required when using ACOPOSmulti SafeMOTION inverter modules! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!
- 21) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 100 m is not permitted to be exceeded):

$$I_{Max} = 7.9 / I_{G} * A * 1/(2*\rho)$$

- I_G ... Max. current consumption of the encoder [A].
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Q mm²/m] (e.g. for copper: ρ = 0.0178)
- 22) $I_{Encoder}$... Max. power consumption of the connected encoder [A].
- 23) Continuous operation at elevations ranging from 500 m to 4,000 m above sea level is possible (taking the specified continuous current reductions into consideration).
- 24) This value only applies in its delivered state (SLOT2 of the module is sealed by a slot cover / shield plate). If SLOT2 on the module is not sealed, then the level of protection is reduced to IP10. It is important to note that a 8SCS005.0000-00 shield set (slot cover / shield plate) or plug-in module must always be inserted!
- 25) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous current reductions into consideration), but this will result in a shorter service life.
- 26) These dimensions refer to the actual device dimensions including the respective mounting plate. Make sure to leave additional space above and below the devices for mounting, connections and air circulation.

3.7.1.4 Wiring

For details, see section 3.7.2 "Wiring: Safe 8x width inverter modules (1-axis modules)" on page 142.

For general information, see section 6 "Wiring" on page 150.

3.7.2 Wiring: Safe 8x width inverter modules (1-axis modules)

	B+	Axis 1: Brake +
B+ B- T+ T-		

Table 76: Connector X4A - Pinout

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

Danger!

The following applies to the SBC output:

- It is not permitted to be wired across modules!
- It is not permitted to be wired as an open emitter!
- It is not permitted to be wired as an open collector!

Danger!

Only an output voltage of \leq 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 µs.

This must be taken into consideration when choosing the motor holding brake!

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Caution!

If B+ and B- are swapped when connecting the permanent magnet holding brakes, then the brakes cannot be opened! ACOPOSmulti inverter modules cannot determine if a holding brake is connected with reverse polarity!

Warning!

Temperature sensors are only permitted to be connected to the X4A/T+ and X4A/T- connectors on an ACOPOSmulti module under the following conditions:

• SLOT1 of the ACOPOSmulti module does not contain an ACOPOSmulti plug-in module to which a temperature sensor is connected on the T+ and T- connections.

Otherwise, the temperature monitoring functions on the ACOPOSmulti module may become ineffective, which in extreme cases can cause the hardware (e.g. motors) connected to the ACOPOSmulti module to be destroyed!

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

Information:

The SafeMOTION module cannot be replaced! The SafeMOTION module and the ACOPOSmulti SafeMOTION inverter module together form a single unit. In the event of an error, the entire module must be replaced.

4 Installation

See the ACOPOSmulti user's manual MAACPM-ENG, chapter "Installation".

Chapter 2 ACOPOSmulti SafeMOTION

5 Dimensioning

See the ACOPOSmulti user's manual MAACPM-ENG, chapter "Dimensioning".

6 Wiring

6.1 General information

6.1.1 EMC-compatible installation

General information

If the directives for electromagnetic compatibility of the installation are followed, the ACOPOSmulti drive system meets the EMC directive 2004/108/EC and low-voltage directives 2006/95/CE. It also meets the requirements for harmonized EMC product standard IEC 61800-3:2004 for industry (second environment).

Additional EMC measures must be implemented by the machine or system manufacturer in the event that the product standard for the machine includes lower limit values or the machine conforms to the IEC 61000-6-4 basic standard. Proof of conformity to required limit values must be provided by the manufacturer or distributor of the machine or system in accordance with the guidelines for implementing the EMC directive.

Additional EMC measures are required when operating ACOPOSmulti drive systems in a residential area or when connecting ACOPOSmulti drive systems to a low voltage system that also supplies buildings in a residential area (first environment) without an intermediate transformer.

Installation notes

- 1. The control cabinet or system must be constructed properly.
- 2. To prevent the effects of disturbances, the following lines must be properly shielded:
 - Motor cables
 - Encoder cables
 - Control cables
 - Data cables
- 3. Inductive switching elements such as contactors or relays must be equipped with corresponding suppressor elements such as varistors, RC elements or damping diodes.
- 4. All electrical connections must be kept as short as possible.
- 5. Cable shields must be attached to designated shield connection clamps and the connector housing.
- 6. Shielded cables with copper braiding or tinned copper braiding must be used. Twisting the braided shield or extending it with single conductors is not permitted.
- 7. Unused cable conductors must be grounded on both sides whenever possible.

6.1.2 Overview

Passive power supply

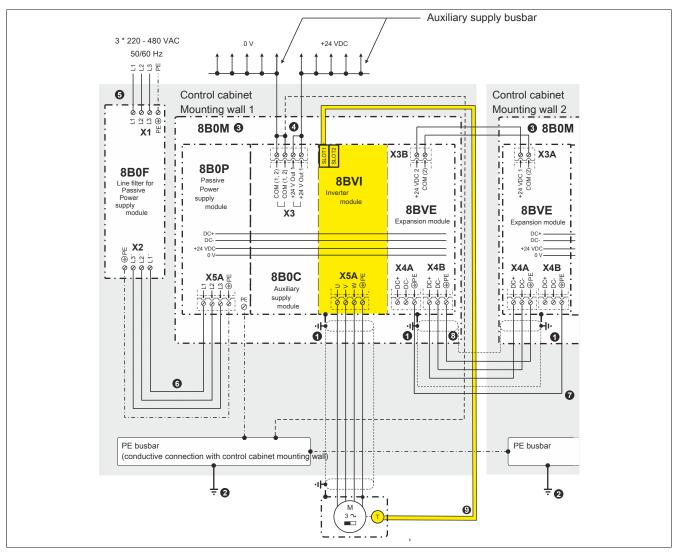

Figure 17: Overview of ground/shield for ACOPOSmulti drive system (passive power supply)

- 1 Shielding connection via module-specific shield component set.
- 2 Central grounding point.
- 3 8B0M mounting plate, large-surface conductive connection with control cabinet mounting wall.
- 4 One of the two COM connections (1, 2) on the X3 connector must be grounded to achieve a defined relationship between the signal ground and ground potential. Otherwise, the Safe Brake Control (SBC) safety function could fail if an error occurs (ground fault).
- 5 The mains power input must be kept as short as possible inside the control cabinet.
- The connection between the line filter and power supply module is never shielded. To prevent disturbances in the mains power input (**6**), they cannot be routed parallel to the connection between the line filter and power supply module.
- An additional PE connection must be made between two 8BVE expansion modules in order to meet the conditions necessary for the ACOPOSmulti drive systems mains connection on all 8B0M mounting plates that are connected using 8BVE expansion modules. This additional PE connection must be made with the same wire cross section as the PE wire routed in the expansion cable (at least 2.5 mm² with protected wiring or 4 mm² with unprotected wiring).
- 9 ACOPOSmulti SafeMOTION EnDat 2.2: Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.

Active power supply

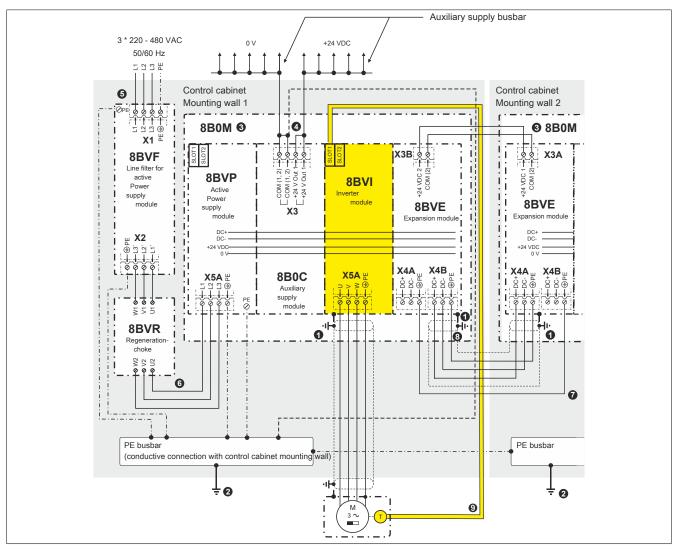

Figure 18: Overview of ground/shield for ACOPOSmulti drive system (active power supply)

- 1 Shielding connection via module-specific shield component set.
- 2 Central grounding point.
- 3 8B0M mounting plate, large-surface conductive connection with control cabinet mounting wall.
- 4 One of the two COM connections (1, 2) on the X3 connector must be grounded to achieve a defined relationship between the signal ground and ground potential. Otherwise, the Safe Brake Control (SBC) safety function could fail if an error occurs (ground fault).
- 5 The mains power input must be kept as short as possible inside the control cabinet.
- The connection between the line filter and power supply module is never shielded. To prevent disturbances in the mains power input (6), they cannot be routed parallel to the connection between the line filter and power supply module.
- An additional PE connection must be made between two 8BVE expansion modules in order to meet the conditions necessary for the ACOPOSmulti drive systems mains connection on all 8B0M mounting plates that are connected using 8BVE expansion modules. This additional PE connection must be made with the same wire cross section as the PE wire routed in the expansion cable (at least 2.5 mm² with protected wiring or 4 mm² with unprotected wiring).
- 9 ACOPOSmulti SafeMOTION EnDat 2.2: Only 8BCF EnDat 2.2 cables from B&R are permitted to be connected to the encoder interfaces.

Danger!

One of the two COM connections (1, 2) on the X3 connector must be grounded to achieve a defined relationship between the signal ground and ground potential. Otherwise, the Safe Brake Control (SBC) safety function could fail if an error occurs (ground fault).

Caution!

No additional consumers/components are permitted to be connected between the 8BVF line filter, 8BVR regeneration choke and 8BVP power supply module!

Warning!

ACOPOSmulti drive systems are only permitted to be used with specially designed line filters. Line filters from third-party manufacturers are not permitted to be used under any circumstances; there is a risk of irreparable damage to these line filters or components of the ACOPOSmulti drive system.

6.1.2.1 Additional PE connection on 8BVE expansion modules

The PE connection must always be made between the first and last 8BVE expansion module.

DC connection between 2 8BVE expansion modules

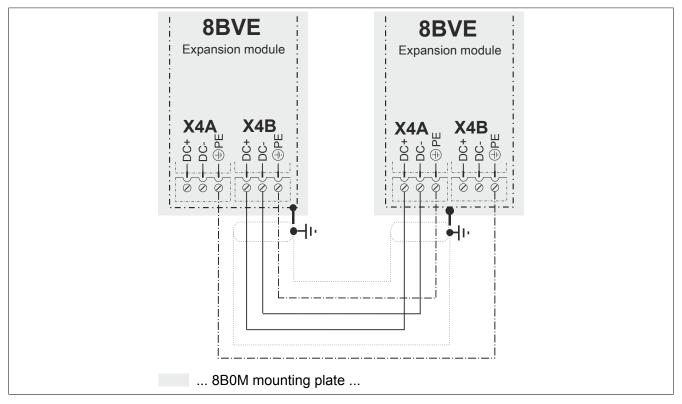

Figure 19: DC connection between 2 8BVE expansion modules

DC connection between more than 2 8BVE expansion modules

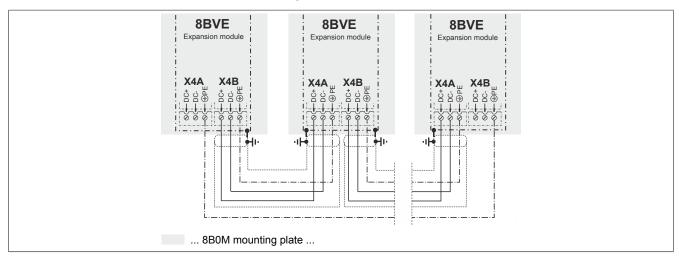

Figure 20: DC connection between more than 2 8BVE expansion modules

Connection between two 8BVE expansion modules in combination with 8CVI inverter modules

Variant 1: 8CVI inverter modules to both 8BVE expansion modules

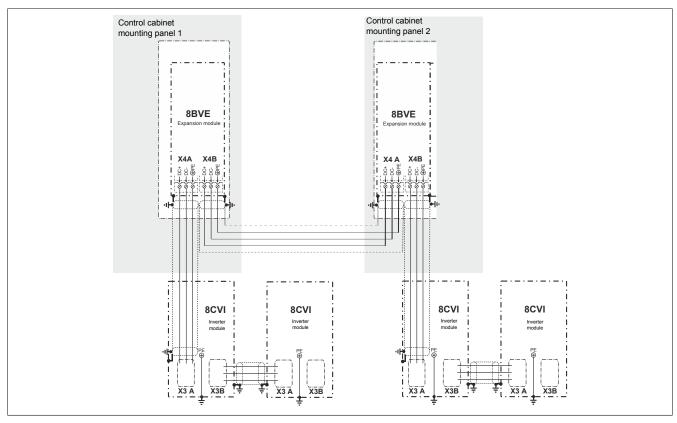

Figure 21: 8CVI inverter module to both 8BVE expansion modules

Variant 2: 8CVI inverter modules to the last 8BVE expansion module

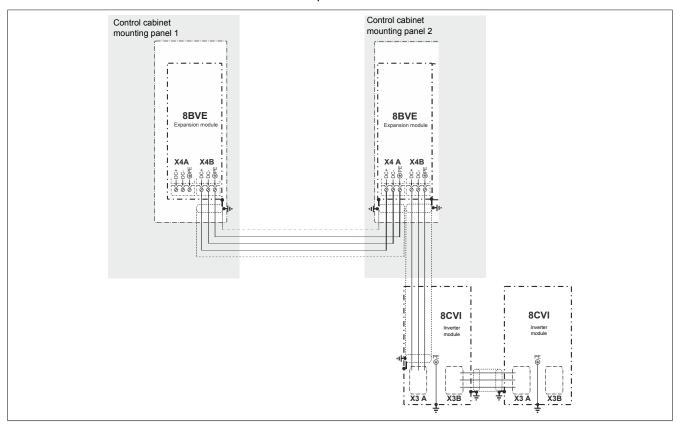

Figure 22: 8CVI inverter modules to the last 8BVE expansion module

6.1.3 Ground and shield connection diagrams

6.1.3.1 8BVI SafeMOTION inverter modules (1-axis modules)

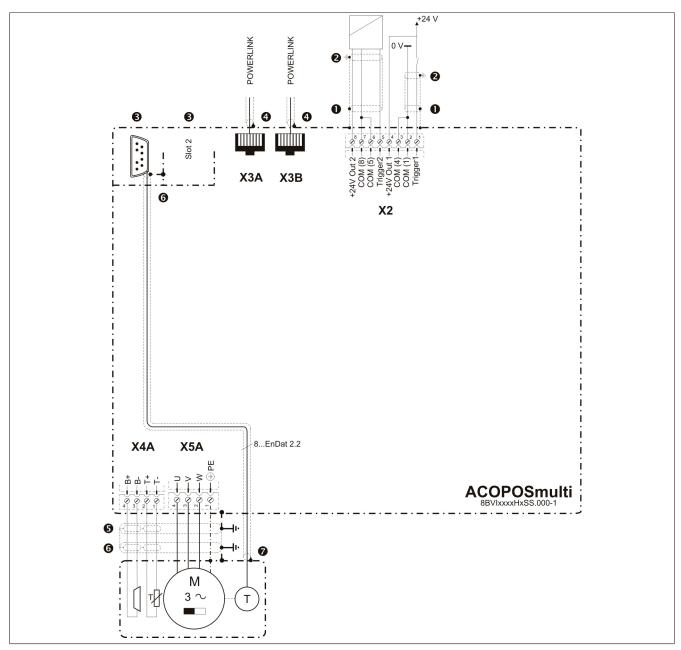

Figure 23: Ground connections and shield connections for 8BVI SafeMOTION EnDat 2.2 inverter modules

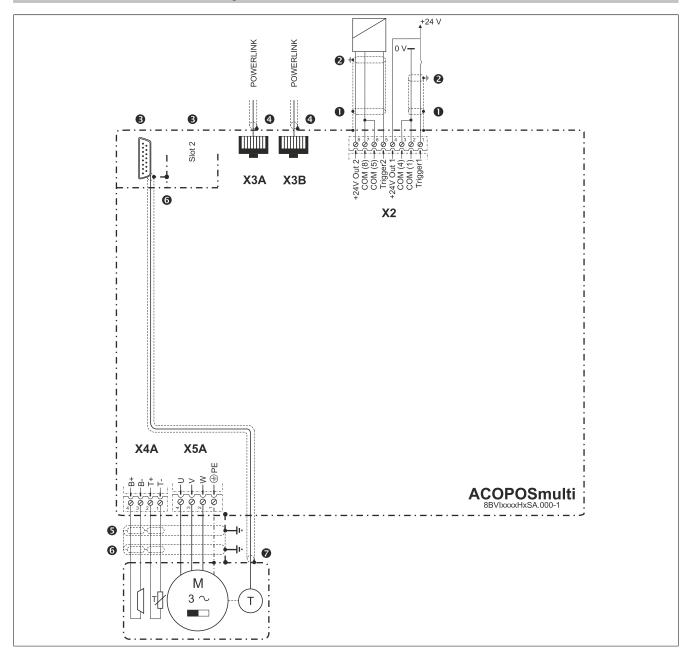

Figure 24: Ground connections and shield connections for 8BVI SafeMOTION SinCos inverter modules

- 1. Both trigger inputs are only filtered internally with approx. 50 μs. Make sure the cable shield is grounded properly. The optional 8SCS002.0000-00 shield set can be used for this.
- 2. The cable shield must be attached to the shield connector.

3. ACOPOSmulti plug-in modules automatically come in contact with the housing when inserted in the module slot:

156 SafeMOTION User's Manual V 4.6.1

Open module slots on ACOPOSmulti modules can be closed with the optional 8SCS005.0000-00 shield set available from B&R. The standard shield set for closing open module slots on ACOPOSmulti SafeMOTION inverter modules is the 8SCS005.0000-00.

4. Cable connection with DSUB connector:

The cable shield must be secured over a wide area in the metallic or metal-plated DSUB housing using the clamp provided for this purpose. The fastening screws on the DSUB housing must be tightened.

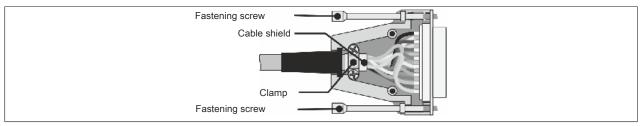

Figure 25: Cable shield in DSUB housing

Cable connection with terminals:

The cable shield must be connected to the housing of the ACOPOSmulti module using optional shielding set 8SCS002.0000-00.

Cable connection with RJ45 connector:

Additional grounding of the cable shield improves the EMC resistance. Grounding should take place on both sides, over a large area and near the connector. The optional 8SCS002.0000-00 shield set, available from B&R, can be used on the ACOPOSmulti module for this.

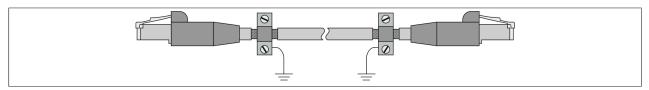

Figure 26: Male RJ45 connector - Grounding the cable shield

Information:

When cabling POWERLINK networks with B&R POWERLINK cables, no additional grounding of the cable shield is required to ensure resistance to disturbances per EN 61800-3!

- 5. The cable shield can be connected to the ACOPOSmulti module housing using the optional shield sets available from B&R.
- 6. On the motor side, the cable shield of the motor line is connected to the motor housing via the motor connector and connected to ground via the machine.
- 7. The cable shield of the encoder cable must be connected to the motor housing on the motor side via the encoder connector and subsequently to ground potential via the machine.

With external encoders, the cable shield of the encoder cable must be connected to the machine on the encoder side via the encoder connector and subsequently to ground potential.

6.1.4 Insulation and high voltage testing

6.1.4.1 Insulation resistance testing in accordance with EN 60204

In accordance with EN 60204, the insulation resistance of electrical equipment is measured with 500 VDC between the main circuit conductors and the protective ground conductor system and is not permitted to fall below the value $1 \text{ M}\Omega$. Testing individual sections of the system is permitted.

Motor connectors on ACOPOSmulti inverter modules (X5A / X5B)

Warning!

An insulation test is not permitted to be carried out on the motor connectors (X5A / X5B) of ACOPOS-multi inverter modules since this would destroy the ACOPOSmulti inverter modules!

The motor cable must be disconnected from the motor connector (X5A / X5B) of the ACOPOSmulti inverter module before insulation resistance is measured!

B&R motors and **B&R** motor cables

In principle, insulation resistance measurement can be carried out on B&R motor cables and B&R motors. The insulation resistance can be lower than 1 M Ω , however, depending on the motor that is connected. The 50 k Ω minimum value required as specified in EN 60204, Section 18.3 is exceeded in any case.

Warning!

An insulation test is not permitted to be carried out on the motor connectors (X5A / X5B) of ACOPOS-multi inverter modules since this would destroy the ACOPOSmulti inverter modules!

The motor cable must be disconnected from the motor connector (X5A / X5B) of the ACOPOSmulti inverter module before insulation resistance is measured!

6.1.4.2 High voltage testing

In accordance with EN 60204, the electrical equipment must be able to withstand a test voltage connected between the conductors of all circuits and the protective ground conductor system for at least 1 s (exception: all circuits with a voltage < PELV voltage). The test voltage must be twice the rated voltage for the equipment, but at least 1000 VAC (50/60 Hz). Components that cannot handle this test voltage must be disconnected before carrying out the high voltage test.

Motor connectors on ACOPOSmulti inverter modules (X5A / X5B)

Warning!

A high voltage test is not permitted to be carried out on the motor connection (X5A / X5B) of ACOPOS-multi inverter modules since this would destroy the ACOPOSmulti inverter modules!

B&R motors and **B&R** motor cables

In principle, high voltage testing can be carried out on B&R motor cables and B&R motors. Depending on the size of the motor and length of the motor cable, increased measurement currents can occur because of capacitive coupling.

Warning!

A high voltage test is not permitted to be carried out on the motor connection (X5A / X5B) of ACOPOS-multi inverter modules since this would destroy the ACOPOSmulti inverter modules!

The motor cable must be removed from the motor connection (X5A / X5B) of the ACOPOSmulti inverter module before the high voltage measurement is made!

6.1.4.3 Typical procedure

Isolation test

- a) Disconnect the motor cable from the X5A / X5B connector on the ACOPOSmulti inverter module.
- b) Perform the insulation test on the X1 mains connection (mains side) of the ACOPOSmulti line filter.
- c) Perform the insulation test on the B&R motor.

High voltage testing

- a) Disconnect the connection cable between the X2 connector of the ACOPOSmulti line filter and the U1 / V1 / W1 connectors of the ACOPOSmulti regeneration choke on the X2 connector of the ACOPOSmulti line filter.
- b) Disconnect the connection cable between the X5A connector on the ACOPOSmulti power supply module and the U2 / V2 / W2 connections of the ACOPOSmulti regeneration choke on the X5A connector of the ACOPOSmulti power supply module.
- c) Perform the high voltage test on the U1 / V1 / W1 connectors of the ACOPOSmulti regeneration choke.
- d) Disconnect the motor cable from the X5A / X5B connector on the ACOPOSmulti inverter module.
- e) Perform the high voltage test on the B&R motor.

Chapter 3 • ACOPOSmotor SafeMOTION

1 System characteristics

1.1 Compact and safe

ACOPOSmotor modules combine the following components in a single compact unit:

- · Servo drive
- Servo motor as an energy transducer
- The built-in position sensor

ACOPOSmotor modules deliver maximum performance through the use of advanced power component technology that minimizes power loss as well as a motor series optimized for motion applications.

Available in 3 different sizes, ACOPOSmotor modules cover the entire spectrum with a torque range of 5.7 to 17 Nm and a power range of 1 kW to 2.3 kW. For applications that demand more power, an optional fan component can be added at any time to boost performance considerably.

1.2 Decentralized and flexible

In terms of topology, the ACOPOSmotor module can be integrated into a simple line or tree structure. Node number assignment takes place automatically in the line structure. If the address still needs to be set, however, this can be done without opening the housing.

The connection to the drive network is made using a hybrid connector. It contains all power and signal lines needed to operate the ACOPOSmotor module as well as those required by the POWERLINK network.

Highly effective IP65 protection allows ACOPOSmotor modules to be mounted directly on the machine. The control cabinet then only has to contain the power supply, high-powered inverter modules and other necessary electromechanical components. This makes it much easier to implement modular machine architectures and optional machine functions since they can be easily connected – with the requisite dimensioning of the power supply – to the machine's main line using hybrid cables.

Also ideal for modular machine engineering is the ability to connect X67 modules directly to ACOPOSmotor modules, something that paves the way for implementing machine modules as completely self-sufficient and testable production units.

1.3 Homogeneous and compatible

ACOPOSmotor modules provide the well-known functionality of the ACOPOSmulti drive family and can therefore be completely integrated into a drive solution.

1.4 Cooling

8DI ACOPOSmotor modules are self-cooling and have a long, slim design. The modules must be installed on the cooling surface (flange).

1.5 ACOPOSmotor SafeMOTION

B&R's well-established safety solution – consisting of X20 SafeIO modules, SafeLOGIC controllers and the SafeDESIGNER toolset in Automation Studio – is rounded off by ACOPOSmulti SafeMOTION inverter modules and ACOPOSmotor SafeMOTION modules. All B&R "Integrated Safety Technology" products are optimized to work together, delivering elegant applications at extremely low cost levels.

openSAFETY sets technical standards

Although there are many new approaches to safe fieldbus systems, most of them are restricted by proprietary standards and sluggish response times. The B&R safety system – including its ACOPOSmotor SafeMOTION modules – takes a different approach by implementing openSAFETY across the board. This approach allows integrated safety functions such as Safely Limited Speed to be activated directly over the network instead of having to wire these types of safety-related signals to the drive.

Information is collected directly from its source via safe digital inputs and outputs before being distributed to the respective sensors and actuators – in this case, the drive with integrated safety functions – via a safe CPU, the SafeLOGIC controller. Connecting over a POWERLINK network makes it easy to achieve the best possible communication between the SafeLOGIC controller and the standard controller for non safety-related program engineering.

Short cycle times

Cycle times of 800 μ s are achieved on ACOPOSmotor SafeMOTION modules while still satisfying SIL 3 requirements.

Modular, expandable system

Because not all drives and axes in a production machine are safety-related, ACOPOSmotor modules are offered both with and without integrated safety functionality (SafeMOTION). This makes it possible to combine safe and non-safe axes in an application as needed.

1.6 ACOPOSmotor configurations

ACOPOSmotor drive systems have access to multiple technology-specific functions whose performance, flexibility and capability have been remarkably proven in countless applications. The ACOPOSmotor functions listed below are basic functions that the user can switch between as needed within 400 µs. In addition, manipulations such as changes in product length, registration mark control, overlying torque control, brief process adaptations and quality checks can be carried out at any time.

- Point-to-point
- Electronic gears
- Electronic compensation gears
- · Cross cutter
- Electronic cams
- Flying saws
- Line shafts
- CNC

ACOPOSmotor drive systems can be used in various configurations depending on the requirements of the application. The functions listed above are available to the user in each of the topology examples shown.

Reaction speeds are not influenced by the control system being used if technology functions are processed directly on the ACOPOSmotor drive system. Additional sensors and actuators must be integrated in the control system for more complex processes. In these cases, the level of performance depends mostly on the type of network and control system being used. The topology examples shown on the following pages provide an overview of the bandwidths that are possible with B&R automation components.

SafeMOTION User's Manual V 4.6.1

Decentralized architecture with ACOPOSremote and ACOPOSmotor

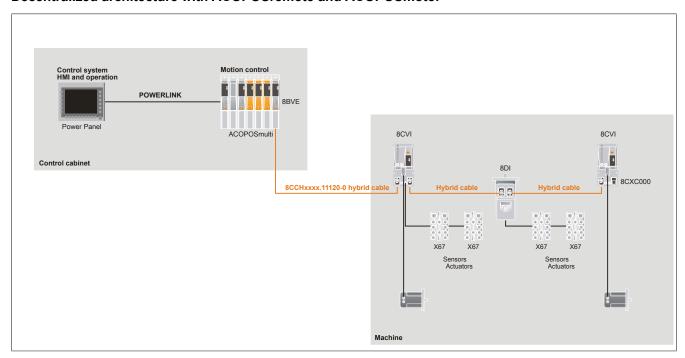

Figure 27: Decentralized architecture with ACOPOSremote and ACOPOSmotor

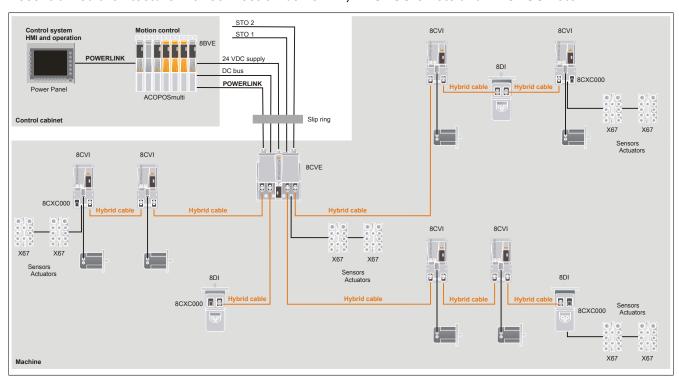

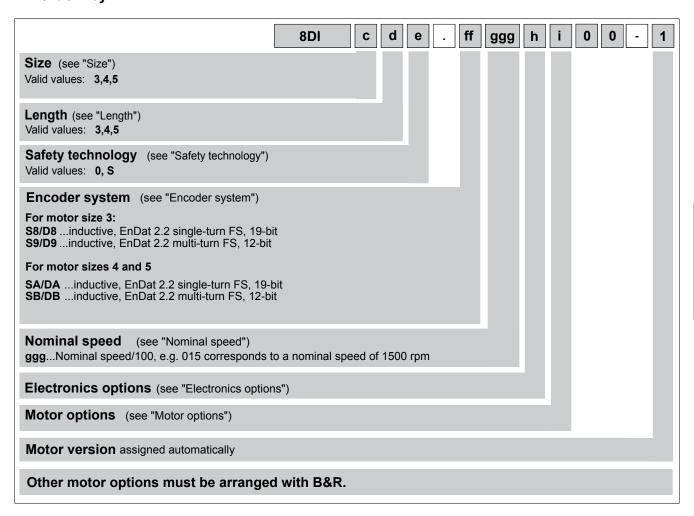

Figure 28: Decentralized architecture with connection box 8CVE, ACOPOSremote and ACOPOSmotor

1.7 Order key

1.7.1 Size (c)

8DI ACOPOSmotor modules are available in three different sizes (3, 4 and 5). They have different dimensions (especially flange dimensions) and power ratings. These different sizes are indicated by a number represented by (c) in the model number. The larger the number, the larger the flange dimensions and power rating for the ACOPOSmotor module.

1.7.2 Length (d)

8DI ACOPOSmotor modules are available in three different sizes. They have different power ratings with identical flange dimensions. These different lengths are indicated by a number represented by (d) in the model number.

Length	Available sizes		
	3	4	5
3	Yes	No	No
4	Yes	Yes	Yes
5	No	Yes	Yes
6	No	Yes	Yes

1.7.3 Safety technology (e)

8DI ACOPOSmotor modules are delivered with wired safety technology or SafeMOTION EnDat 2.2. as a standard feature.

Name	Note	Code for order key
Wired safety technology		0
SafeMOTION EnDat 2.2		S

The following table lists the safety functions integrated in ACOPOSmotor SafeMOTION modules as well as the safety levels that can be achieved when they are used:

Safety function	ACOPOSmotor SafeMOTION	EN ISO 13849-1	EN 61508 / EN 62061	Safe Encoder evaluation Necessary
	Starting in Safe- ty Release			
Safe Torque Off (STO)	R 1.10	PL e / Cat. 4	SIL 3	No
Safe Torque Off One Channel (STO1)	R 1.10	PL d / Cat. 3	SIL 2	No
Safe Operation Stop (SOS)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safe Stop 1 (SS1)	R 1.10	Time-based monitoring: PL e / Cat. 4 Ramp-based monitoring: PL d / Cat. 3	Time-based monitoring: SIL 3 Ramp-based monitoring: SIL 2	Time-based monitoring: No Ramp-based monitoring: Yes
Safe Stop 2 (SS2)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safely Limited Speed (SLS)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safe Maximum Speed (SMS)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safe Direction (SDI)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safely Limited Increment (SLI)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safely Limited Acceleration (SLA)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safe Brake Control (SBC) 1)	R 1.10	PL d / Cat. 3	SIL 2	No
Safely Limited Position (SLP)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safe Maximum Position (SMP)	R 1.10	PL d / Cat. 3	SIL 2	Yes
Safe Homing	R 1.10	PL d / Cat. 3	SIL 2	Yes
Remanent Safe Position (RSP)	R 1.10	PL d / Cat. 3	SIL 2	Yes

Table 80: ACOPOSmotor SafeMOTION: Safety functions and associated safety levels

1.7.4 Encoder system (ff)

EnDat 2.2 encoder

General information

Digital drive systems and position control loops require fast and highly secure transfer of data obtained from position measuring instruments. In addition, other data such as drive-specific characteristics, correction tables, etc. should also be available. To ensure a high level of system security, measuring instruments must be integrated in routines for detecting errors and be able to perform diagnostics.

The EnDat interface from HEIDENHAIN is a digital, bidirectional interface for measuring instruments. It is able to output position values from incremental and absolute measuring instruments and can also read and update information on the measuring instrument or store new data there. Because it relies on serial data transfer, only 4 signal lines are needed. Data is transferred synchronously to the clock signal defined by the subsequent electronics. The type of transfer used (e.g. for position values, parameters, diagnostics, etc.) is selected using mode commands sent to the measuring instrument by the subsequent electronics.

As a serial interface, EnDat 2.2 is also suitable for safety-related applications up to SIL 3.

¹⁾ Safety function SBC does not apply to the motor holding brake integrated in the ACOPOSmotor SafeMOTION; it is not safety-related.

5	Yes	Yes	Yes	No	No
Length	4	5	6	3	4

1.7.6 Electronics options (h)

8DI ACOPOSmotor modules are available with optional external connections:

- · One additional POWERLINK connection
- Two 24 VDC outputs for supplying external components (e.g. X67 modules)
- Two trigger inputs

The respective execution of the module is listed in the form of a 1-digit code (h) as part of the model number.

POWERLINK	24 VDC outputs (2x)	Trigger inputs (2x)	Code for order key
No	No	No	0
Yes	Yes	Yes	7

¹⁰ to 55 Hz, constant path, 4.9 mm peak to peak

¹⁰ to 55 Hz, constant lift, 4.9 mm peak to peak

¹⁰ to 55 Hz, constant amplitude, 4.9 mm peak to peak

In accordance with the standard at room temperature; the following values apply at a working temperature up to 100°C: ≤300 m/s², up to 115°C: ≤150 m/s². 10 to 55 Hz, constant path, 4.9 mm peak to peak

¹⁰ to 55 Hz, constant lift, 4.9 mm peak to peak 10 to 55 Hz, constant amplitude, 4.9 mm peak to peak

1.7.7 Motor options (i)

8DI ACOPOSmotor modules are available with the following features depending on size and length:

- · With or without a holding brake
- · With a smooth or keyed shaft end
- · With or without an oil seal

The respective combination of motor options is listed in the form of a 1-digit code (i) as part of the model number.

Code for order key (i)	Holding brake	Design of the shaft end	Oil seal
0		Smooth shaft end	No
1	No -		Yes
2		Keyed shaft end	No
3			Yes
4		Smooth shaft end	No
5	Yes		Yes
6		Keyed shaft end	No
7			Yes

Holding brake

All 8DI ACOPOSmotor modules can be delivered with a holding brake. It is installed directly behind the A-side flange on the module and is used to hold the motor shaft when the power is switched off on the ACOPOSmotor module.

The holding brake is a spring-loaded brake. Based on principle, this type of holding brake exhibits a minimal amount of backlash.

This brake is designed as a holding brake and is not permitted to be used for operational braking! Under these conditions, the brake has a service life of approximately 5,000,000 cycles (opening and closing the brake is one cycle). Loaded braking during an emergency stop is permitted but reduces its service life. The required brake holding torque is determined based on the actual load torque. If not enough information is known about the load torque, it is recommended to assume a safety factor of 2.

Name	ACOPOSmotor module			
	8DI3	8DI4	8DI5	
Holding torque M _{Br} [Nm]	3.2	9	18	
Connected load Pon [W]	12	18	24	
Activation delay ton [ms]	29	40	50	
Release delay t _{off} [ms]	19	7	10	
Moment of inertia J _{Br} [kgcm²]	0.38	0.54	1.66	
Mass m _{Br} [kg]	0.3	0.46	0.9	

Table 81: Technical data for the holding brake per ACOPOSmotor module

Design of the shaft end

8DI ACOPOSmotor module shafts comply with the DIN 748 standard and are available with a smooth or keyed shaft end.

Smooth shaft end

A smooth shaft end is used for a force-fit shaft-hub connection and guarantees a backlash-free connection between the shaft and hub as well as a high degree of operating smoothness. The end of the shaft has a threaded center hole.

Keyed shaft end

A keyed shaft end is used for a form-fit torque transfer with low demands on the shaft-hub connection and for handling torque in a constant direction.

The keyways for 8DI ACOPOSmotor modules conform to keyway form N1 in accordance with DIN 6885-1. Form A keyed shafts that conform to DIN 6885-1 are used. Balancing motors with keyways is done using the shaft and fitment key convention in accordance with DIN ISO 8821.

The end of the shaft has a threaded center hole that can be used to mount machine actuators with shaft end cover plates.

Oil seal

All 8DI ACOPOSmotor modules are available with an optional Form A oil seal in accordance with DIN 3760.

When equipped with an oil seal, 8DI ACOPOSmotor modules have IP65 protection in accordance with EN 60034-5. Proper lubrication of the oil seal must be ensured throughout the entire service life of the motor.

1.7.8 Version

ACOPOSmotor module versions are assigned automatically.

1.8 8ZDFB fan kits

8DI ACOPOSmotor modules can be optionally equipped with a fan kit depending on size. The fan kit considerably improves the nominal values of 8DI ACOPOSmotor modules (see speed-torque characteristic curve for the respective 8DI ACOPOSmotor module).

The fan kit is mounted on the back of the 8DI ACOPOSmotor module, with 24 VDC supplied to the fan kit either externally or via connector X31 on the ACOPOSmotor module (8DIcde.ffggg7i00-1).

Size	Corresponding fan kit
3	In preparation
4	8ZDFB400000.000-0
5	8ZDFB500000.000-0

1.9 Load capacity of the shaft end and bearings

8DI ACOPOSmotor modules are equipped with grooved ball bearings that are sealed on both sides and lubricated. Radial and axial forces (F_r, F_a) applied to the shaft end during operation and installation must be within the specifications listed below. Bearing elements must not be subjected to shocks or impacts! Incorrect handling will reduce the service life and result in damage to the bearings.

The axial forces F_a permitted during the installation of pinion gears, couplings, etc. depend on the size of the ACOPOSmotor module and can be found in the following table:

Size	Permissible axial force F _a [N]
	Standard bearing
3	1400
4	2300
5	2500

Radial force

The radial force F_r on the shaft end is a function of the loads during installation (e.g. belt tension on pulleys) and operation (e.g. load torque on the pinion). The maximum radial force F_r depends on the shaft end type, bearing type, average speed, the position where the radial force is applied and the desired service life of the bearings.

Axial force, shift in shaft position caused by axial force

The axial force F_a on the shaft end is a function of the loads during installation (e.g. stress caused by mounting) and operation (e.g. thrust caused by slanted tooth pinions). The maximum axial force F_a depends on the bearing type and the desired lifespan of the bearings. The fixed bearing is secured on the A flange with a retaining ring. The floating bearing is preloaded on the B flange with a spring in the direction of the A flange. Axial forces in the direction of the B flange can cause the spring bias to be overcome, which shifts the shaft by the amount of axial backlash in the bearing (approx. 0.1 - 0.2 mm). This shift can cause problems on ACOPOSmotor modules with holding brakes or ACOPOSmotor modules with EnDat encoders (D8, D9, DA and DB). As a result, no axial force is permitted in the direction of the B flange when using these ACOPOSmotor modules.

Axial loads are not permitted on shaft ends of ACOPOS motor modules with holding brakes. It is especially important to prevent axial forces in the direction of the B flange since these forces can cause the brake to fail!

Determining permissible values of F_r and F_a

ACOPOSmotor SafeMOTION • System characteristics

Information for determining permissible values of F_r and F_a can be found in the technical data for the respective ACOPOSmotor modules. Permissible values are based on a bearing lifespan of 20,000 h (bearing lifespan calculation based on DIN ISO 281).

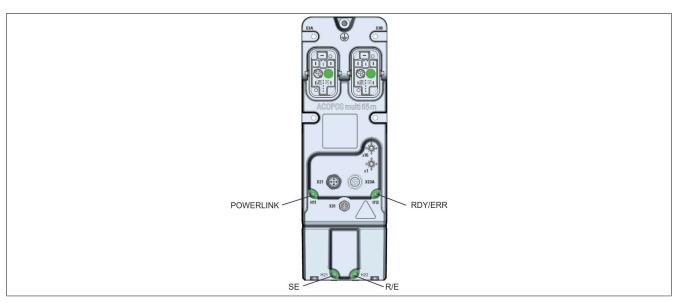

Figure 30: ACOPOSmotor SafeMOTION - Display

2.1.1 LED status indicators

Status indicator group	Label	Color	Function	Description
POWERLINK	R/E	Green/Red	Ready/Error	see "POWERLINK - LED status indicators" on
				page 169
Power inverter	RDY	Green	Ready	see "RDY/ERR - LED status indicators" on page
	RUN	Orange	Run	169
	ERR	Red	Error	
Power supply	24 V	Green	24 V OK	The 24 V module power supply voltage is within the
				tolerance range.
Status of SafeMOTION module	R/E	Green/Red	Ready/Error	see "SafeMOTION module - LED status indicators"
Safety status of SafeMOTION module	SE	Red	Safe/Error	on page 170

Table 82: 8BVI SafeMOTION inverter modules (1-axis modules) - LED status indicators

2.1.2 RDY/ERR - LED status indicators

Label	Color	Function	Description	
H12	Green	Ready	Solid green	The module is operational and the power stage can be enabled (operating system present and booted, no permanent or temporary errors).
			Blinking green	The module is not ready for operation.
				Examples:
				No signal on one or both enable inputs
				DC bus voltage outside the tolerance range
				Overtemperature on the motor (temperature sensor)
				Motor feedback not connected or defective
				Motor temperature sensor not connected or defective
				Overtemperature on the module (IGBT junction, heat sink, etc.)
				Disturbance on network
	Red	Error	Solid red	There is a permanent error on the module.
				Examples:
				Permanent overcurrent
				Invalid data in EPROM

Table 83: RDY/ERR - LED status indicators

2.1.3 POWERLINK - LED status indicators

Label	Color	Function	Description	Description	
H11	Green/Red	Ready/Error	LED off	The module is not receiving power or initialization of the network interface has failed.	
			Solid red	Solid red The POWERLINK node number of the module is 0.	
			Blinking red/green	The client is in an error state (drops out of cyclic operation).	

Table 84: POWERLINK - LED status indicators

SafeMOTION User's Manual V 4.6.1

ACOPOSmotor SafeMOTION • Status indicators

Label	Color	Function	Description	
			Blinking green (1x)	The client detects a valid POWERLINK frame on the network.
			Blinking green (2x)	Cyclic operation on the network is taking place, but the client itself is not yet a participant.
			Blinking green (3x)	Cyclic operation of the client is in preparation.
			Solid green	The client is participating in cyclic operation.
			Flickering green	The client is not participating in cyclic operation and also does not detect any other stations on the network participating in cyclic operation.

Table 84: POWERLINK - LED status indicators

2.1.4 SafeMOTION module - LED status indicators

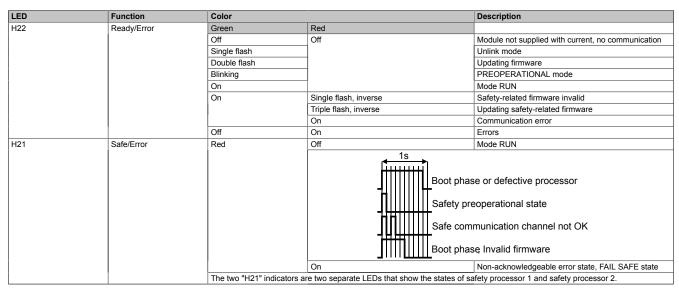

Table 85: SafeMOTION module - LED status indicators

Danger!

Constantly lit "SE" LEDs indicate a non-acknowledgeable FAIL SAFE state. The cause of this could be a defective module or faulty configuration.

Check the entries in the logbook! If you are able to rule out a faulty configuration, then the module is defective and must be replaced immediately.

It is your responsibility to ensure that all necessary repair measures or corrections to the configuration are initiated after an error occurs since subsequent errors can result in dangerous situations!

2.1.5 Status changes when starting up the operating system loader

The following intervals are used for the LED status indicators:

Width of box: 50 ms Repeats after: 3,000 ms

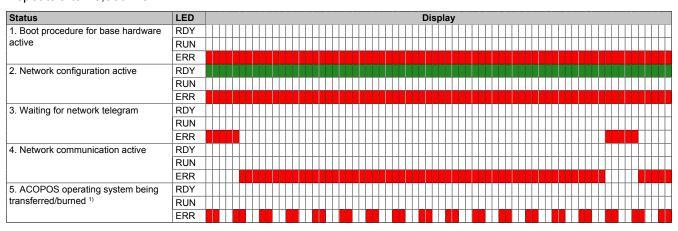

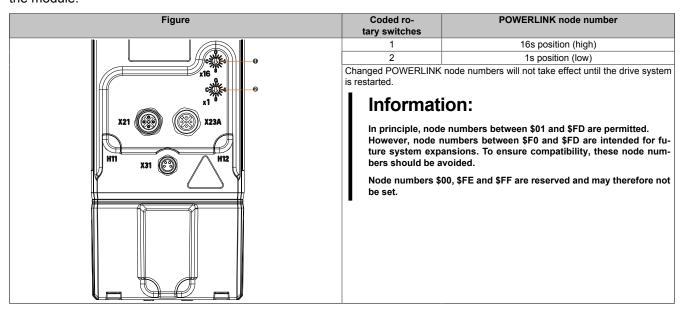

Table 86: Status changes when starting up the operating system loader

Firmware V2.140 and later.

2.1.6 POWERLINK node number setting

The POWERLINK station number can be set using the two coded hexadecimal rotary switches located on top of the module:

3 Data sheets

3.1 ACOPOSmotor SafeMOTION modules

Danger!

An ACOPOSmotor SafeMOTION module can only be replaced in its entirety. Replacing individual components is not possible since they are permanently installed.

3.1.3 Technical data

3.1.3.1 General information

Product ID		
General information		
Module type	ACOPOSmotor module	
Current-carrying capacity of the 19-pin hybrid con-		
nector		
Power contacts	Max. 20 A at 40°C	
Certification		
CE	Yes	
cULus	In preparation	
FSC	In preparation	
Support		
Software		
ACP10	V3.14 or higher	
Thermal characteristics		
Methods of cooling in accordance with EN 60034-6 (IC code)		
Standard	Self-cooled; no separate surface cooling (IC4A0A0)	
With 8ZBDF fan kit installed	Externally-cooled; surface cooling with independent cooling module attached (IC4A0A6)	
Operating conditions		
Construction and mounting arrangement type in accordance with EN 60034-7 (IM code)	Horizontal (IM3001); Vertical, motor stands on the machine (IM3031)	
Reduction of the nominal current and stall current at installation elevations over 500 m above sea level	10% per 1000 m	
Reduction of the continuous power at installation elevations over 500 m above sea level	10% per 1000 m	
Installation at elevations above sea level		
Nominal	0 to 500 m	
Maximum 1)	4000 m	
Pollution degree in accordance with EN 60664-1	2 (non-conductive pollution)	
Overvoltage category in accordance with IEC 60364-4-443:1999	III	
EN 60529 protection ²⁾	Without optional oil seal: IP64 With optional oil seal: IP65 With 8ZDFB fan kit installed: IP24

Product ID		
Environmental conditions		
Temperature		
Operation		
Nominal	5 to 40°C	
Maximum	55°C ³⁾	
Storage	-25 to 55°C	
Transport	-25 to 70°C	
Max. flange temperature	65°C	
Relative humidity		
Operation	5 to 85%, non-condensing	
Storage	5 to 95%, non-condensing	
Transport	Max. 95% at 40°C	
Mechanical characteristics		
Motor coating	Water-based paint, RAL 9005 flat	
Inverter coating	Electrophoretic deposition (EPD), black	
Vibration severity in accordance with EN 60034-14	Vibration severity grade A 4)	
Roller bearing, dynamic load ratings and nominal	Based on DIN ISO 281	
service life		
Shaft end in accordance with DIN 748	Form E	
Oil seal in accordance with DIN 3760	Form A	
Key and keyway in accordance with DIN 6885-1	Keyway form N1; key form A	
Balancing the shaft in accordance with DIN ISO 8821	Half-key arrangement	
Mounting flange in accordance with DIN 42948	Form A	
Smooth rotation of shaft end, coaxial properties and mounting flange plane in accordance with DIN 42955	Tolerance R	

Table 89: General information - Technical data

- 1) Continuous operation at elevations ranging from 500 m to 4000 m above sea level is possible (taking the specified continuous current reductions into consideration). Requirements that go beyond this must be arranged with B&R.
- 2) The specified level of protection is only in place if all connectors on the module that are not being used are closed with suitable caps or covers. Suitable caps and covers are available as optional accessories (X67AC0M08, X67AC0M12, 8CXC000.0000-00). The module is rated at IP20 when delivered.
- 3) Continuous operation at ambient temperatures ranging from 40°C to max. 55°C is possible (taking the specified continuous torque reductions into consideration), but this will result in a shorter service life.
- 4) Vibration severity grade B on request.

Table 90: 8DIcde.ffggg7i00-1, 8DIcde.ffggg0i00-1 - Technical data

- 1) Valid in the following conditions: 750 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 2) It is important to note that the 19-pin hybrid connector is designed for max. 5 connection cycles.
- 3) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 4) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output (power unit: limit speed exceeded).
- 5) Limited to 30 m when using hybrid cables.
- 6) The enable inputs are continuous. They have no function on SafeMOTION modules, however.

3.1.3.3 Encoder

3.1.7 Pinouts

Danger!

Before performing service work, disconnect the power supply and wait 5 minutes to ensure that the DC bus of the drive system has discharged. Observe regulations!

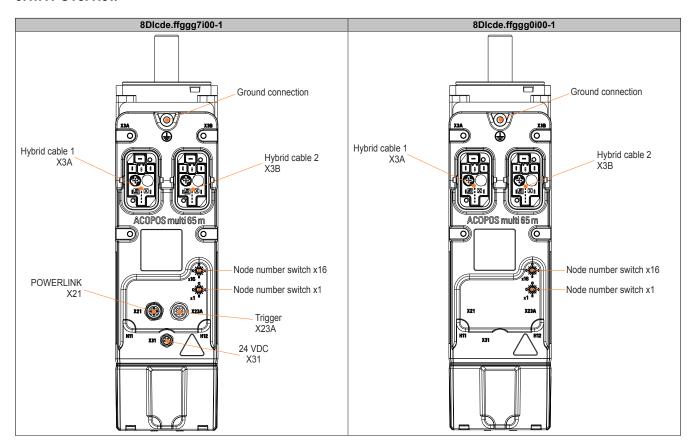

Warning!

Drive systems can carry high levels of electrical voltage. Never connect or disconnect the connector when voltage is present!

Information:

To satisfy UL/CSA requirements, components of B&R drive systems are only permitted to be wired with copper wires with a permitted wire temperature of at least 75°C.

3.1.7.1 Overview

3.2.2 Fan kits

8DI ACOPOSmotor modules can be optionally equipped with a fan kit depending on size. The fan kit considerably improves the nominal values of 8DI ACOPOSmotor modules (see speed-torque characteristic curve for the respective 8DI ACOPOSmotor module).

¹⁾ In cable drag chain operation.

Information:

ACOPOSmotor 8DI modules automatically take into account the improvement of rated values with fan kit 8ZDFB via the evaluation of the module-internal temperature sensor. The motor parameters therefore do not need to be adjusted in Automation Studio.

A separate data set is available in SERVOsoft for ACOPOSmotor 8DI modules with and without fan kit 8ZDFB.

Table 116: ACOPOS P3 8EI servo drive - Order key

1.1.1 Continuous current A_{eff} (ccc)

The continuous current A_{eff} of the ACOPOS P3 8EI servo drive is listed in the form of a 3-digit code (ccc) as part of the model number.

Continuous current A _{eff}	Order code (ccc)	1-axis module	2-axis module	3-axis module
1.6 A	1X6	Yes	No	No
2.2 A	2X2	Yes	Yes	Yes
4.5 A	4X5	Yes	Yes	Yes
8 8 A	8X8	Yes	Yes	Yes

Table 117: Continuous current (ccc)

1.1.2 Plug-in modules (i)

ACOPOS P3 8EI servo drives can be configured with our without an included plug-in module. The selected plug-in module is added to the content of delivery and included in the package containing the servo drive.

Order code (i)	Plug-in module	
A	Resolver 1x interface	8EAC0122.001-1
С	Resolver 3x interface	8EAC0122.003-1
Н	Digital multi-encoder interface, 1x interface	8EAC0150.001-1
J	Digital multi-encoder interface, 3x interface	8EAC0150.003-1
M	Analog multi-encoder interface, 1x interface	8EAC0152.001-1
N	Analog multi-encoder interface, 3x interface	8EAC0152.003-1
0	No plug-in module included in delivery	

Table 118: Plug-in modules (i)

¹⁾ Placeholder for the respective option or configuration.

1.1.3 Configurable accessories (j)

ACOPOS P3 8EI servo drives can be configured to include accessories. The selected accessories are added to the content of delivery and included in the package containing the servo drive.

Order code (j)	Internal braking resistor	Front cover	Connector set 2 (2-row)	Connector set 1 (1-row)
0	No	No	No	Yes
1	No	No	Yes	No
2	No	Yes	No	Yes
3	No	Yes	Yes	No
4	Yes	No	No	Yes
5	Yes	No	Yes	No
6	Yes	Yes	No	Yes
7	Yes	Yes	Yes	No
Α	No	No	No	No
В	No	Yes	No	No
С	Yes	No	No	No
D	Yes	Yes	No	No

Table 120: 8EI SafeMOTION servo drives - Status indicators

1.2.1.2 POWERLINK - LED status indicators

Label	Color	Description	
PLK	Green	Blinking green (1x)	The client detects a valid POWERLINK frame on the network.
		Blinking green (2x)	Cyclic operation on the network is taking place, but the client itself is not yet a participant.
		Blinking green (3x)	Cyclic operation of the client is in preparation.
		Solid green	The client is participating in cyclic operation.
		Flickering green	The client is not participating in cyclic operation and also does not detect any other stations on the network participating in cyclic operation.
	Red	Solid red	The POWERLINK node number of the module is 0.
		Blinking red/green	The client is in an error state (drops out of cyclic operation).
	Orange	Solid orange	Module booting

Table 121: POWERLINK - LED status indicators

1.2.1.3 Ax1/Ax2/Ax3 - LED status indicators

Label	Color	Function	Description	
Ax1 Ax2	Green	Ready	Solid green	The module is operational and the power stage can be enabled (operating system present and booted, no permanent or temporary errors).
Ax3			Blinking green	The module is not ready for operation.
				Examples:
				No signal on one or both enable inputs
				DC bus voltage outside the tolerance range
				Overtemperature on the motor (temperature sensor)
				Motor feedback not connected or defective
				Motor temperature sensor not connected or defective
				Overtemperature on the module (IGBT junction, heat sink, etc.)
				Disturbance on network
	Red	Error	Solid red	There is a permanent error on the module.
				Examples:
				Permanent overcurrent
				Invalid data in EPROM
			Blinking red	Burning ACOPOS P3 operating system
	Orange	Run	Solid orange	The module's power stage is enabled.
			LED off	No voltage being supplied to module

Table 122: Ax1/Ax2/Ax3 - LED status indicators

1.2.1.4 R/E and SE - LED status indicators

LED	Color		Description
R/E	Green	Red	
	Off	Off	Module not supplied with power, no communication
	Single flash		Mode "Unlink"
	Double flash		Updating firmware
	Blinking		Mode PREOPERATIONAL
	On		Mode RUN
	On	Single flash, inverse	Safety-related firmware invalid
		Triple flash, inverse	Updating safety-related firmware
		On	Communication error
	Off	On	Error

Table 126: 8EI1X6MWSS0.XXXX-1, 8EI2X2MWSS0.XXXX-1, 8EI4X5MWSS0.XXXX-1, 8EI8X8MWSS0.XXXX-1 - Technical data

1) A line filter must be connected.

CE compliance can only be ensured by connecting a B&R line filter (8x0F...).

In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.

2) P_{AVG} ... Average continuous power of the module

 $I_{AX1} \dots RMS$ value of the current on axis 1

 $I_{\text{BR1}} \dots Nominal$ current of the motor holding brake for axis 1

 $P_{\text{VSLOT}} \dots Power dissipation of the 8EAC plug-in module$

3) P_{AVG} ... Average continuous power of the module

IAX1 ... RMS value of the current on axis 1

 I_{BR1} ... Nominal current of the motor holding brake for axis $1\,$

 P_{VSLOT} ... Power dissipation of the 8EAC plug-in module

- 4) Maximum cable length between line filter and mains connection on the module.
- 5) Valid for a mains input voltage of 230 VAC.

The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.

- 6) The value can be higher under certain conditions.
- 7) This value applies to unshielded wiring inside a control cabinet.

Maximum length of the DC bus wiring inside a control cabinet.

- 8) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 9) Valid under the following conditions: 325 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 10) The temperature specifications refer to the ambient temperature.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 12) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 13) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 14) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 15) The sum of the length of all motor cables connected to this module is not permitted to exceed this value.
- 16) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 17) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified cable length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 18) There is a connection for external braking resistors. An internal braking resistor is available as an option.
- 19) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 20) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 21) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

 $I_{max} = f / I_{G} * A * 1/(2*\rho)$

- $f.... \ (Output \ voltage \ of \ encoder \ interface \ [V] Min. \ permissible \ supply \ voltage \ of \ connected \ encoder \ [V]) \ ^{\star} \ 1.1$
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires $\left[\text{mm}^2\right]$
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 22) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 23) Output voltage 5.2 V is only available under the following conditions:
 - 8EI servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8EI servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 24) Except encoder type HIPERFACE DSL.
- 25) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 26) I_{ENCODER} ... Current consumption of the encoder
 - U_{24V} ... Input voltage on the +24 VDC input of the module
- 27) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

Wall mounting		258.5 mm (with 8EXA	front cover: 261 mm)	
Weight		3.2	kg	

Table 129: 8EI1X6HWSS0.XXXX-1, 8EI2X2HWSS0.XXXX-1, 8EI4X5HWSS0.XXXX-1, 8EI8X8HWSS0.XXXX-1 - Technical data

1) A line filter must be connected.

CE compliance can only be ensured by connecting a B&R line filter (8x0F...).

In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.

2) P_{AVG} ... Average continuous power of the module

 $I_{\text{AX1}} \dots \text{RMS}$ value of the current on axis 1

 $I_{\text{BR1}} \dots Nominal$ current of the motor holding brake for axis 1

 $P_{\text{VSLOT}} \dots Power dissipation of the 8EAC plug-in module$

3) P_{AVG} ... Average continuous power of the module

IAX1 ... RMS value of the current on axis 1

 I_{BR1} ... Nominal current of the motor holding brake for axis $1\,$

 P_{VSLOT} ... Power dissipation of the 8EAC plug-in module

- 4) Maximum cable length between line filter and mains connection on the module.
- 5) Valid for a mains input voltage of ≥3x 400 VAC.

The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.

- 6) The value can be higher under certain conditions.
- 7) This value applies to unshielded wiring inside a control cabinet.

Maximum length of the DC bus wiring inside a control cabinet.

- 8) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 9) Valid under the following conditions: 560 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 10) The temperature specifications refer to the ambient temperature.
- 11) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 12) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 13) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 14) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 15) The sum of the length of all motor cables connected to this module is not permitted to exceed this value.
- 16) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 17) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified cable length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 18) There is a connection for external braking resistors. An internal braking resistor is available as an option.
- 19) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 20) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 21) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

 $I_{max} = f / I_{G} * A * 1/(2*\rho)$

- f... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 22) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 23) Output voltage 5.2 V is only available under the following conditions:
 - 8EI servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8EI servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 24) Except encoder type HIPERFACE DSL.
- 25) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 26) I_{ENCODER} ... Current consumption of the encoder
 - $U_{\mbox{\tiny 24V}} \mbox{ ... }$ Input voltage on the +24 VDC input of the module
- 27) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

1.2.2.2.2 Continuous power 6.5 kW to 8.5 kW (motor connection)

Weight	4 kg		

Table 132: 8EI013HWSS0.XXXX-1, 8EI017HWSS0.XXXX-1 - Technical data

- 1) A line filter must be connected.
 - CE compliance can only be ensured by connecting a B&R line filter (8x0F...).
 - In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.
- 2) Maximum line length between line filter and mains connection on the module.
- 3) Valid for a mains input voltage of ≥3x 400 VAC.
 - The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.
- 4) The value can be higher under certain conditions.
- This value applies to unshielded wiring inside a control cabinet.
 - Maximum length of the DC bus wiring inside a control cabinet.
- 6) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 7) Valid under the following conditions: 560 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 8) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.

- 9) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 10) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 11) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 12) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified line length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 13) There is a connection for external braking resistors. An internal braking resistor is available as an option.
- 14) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 15) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 16) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

$$I_{max} = f / I_G * A * 1/(2*\rho)$$

- f ... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 17) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 18) Output voltage 5.2 V is only available under the following conditions:
 - 8EI servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8EI servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 19) Except encoder type HIPERFACE DSL.
- 20) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 21) I_{ENCODER} ... Current consumption of the encoder
 - $U_{\text{24V}} \dots$ Input voltage on the +24 VDC input of the module
- 22) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

Table 135: 8EI024HWSS0.XXXX-1, 8EI034HWSS0.XXXX-1, 8EI044HWSS0.XXXX-1 - Technical data

- 1) A line filter must be connected
 - CE compliance can only be ensured by connecting a B&R line filter (8x0F...).
 - In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.
- 2) Maximum line length between line filter and mains connection on the module.
- 3) Valid for a mains input voltage of ≥3x 400 VAC.
 - The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.
- 4) The value can be higher under certain conditions.
- 5) This value applies to unshielded wiring inside a control cabinet.
 - Maximum length of the DC bus wiring inside a control cabinet.
- 6) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 7) Valid under the following conditions: 560 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 8) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.

- 9) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 10) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 11) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 12) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified line length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 13) This values apply to an external braking resistor. This module is not equipped with an internal braking resistor.
- 14) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 15) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 16) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

$$I_{max} = f / I_{G} * A * 1/(2*\rho)$$

- f ... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 17) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 18) Output voltage 5.2 V is only available under the following conditions:
 - 8EI servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8EI servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 19) Except encoder type HIPERFACE DSL.
- 20) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 21) I_{ENCODER} ... Current consumption of the encoder
 - $U_{\text{24V}} \dots$ Input voltage on the +24 VDC input of the module
- 22) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

1.2.3 2-axis modules

1.2.3.1 Mains input voltage - 1x 110 to 230 VAC / 3x 200 to 230 VAC

1.2.3.1.1 Continuous power up to 2 kW (motor connection)

Table 138: 8EI2X2MWDS0.XXXX-1, 8EI4X5MWDS0.XXXX-1, 8EI8X8MWDS0.XXXX-1 - Technical data

A line filter must be connected.

CE compliance can only be ensured by connecting a B&R line filter (8x0F...).

In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.

P_{AVG} ... Average continuous power of the module

 $I_{\text{AX1}},\,I_{\text{AX2}}\,...$ RMS value of the current on axis 1, axis 2

 $I_{\text{BR1}},\,I_{\text{BR2}}$... Nominal current of the motor holding brake on axis 1, axis 2

 $P_{\text{VSLOT}} \dots Power dissipation of the 8EAC plug-in module$

- 3) P_{AVG} ... Average continuous power of the module
 - $I_{AX1},\,I_{AX2}$... RMS value of the current on axis 1, axis 2
 - $I_{\text{BR1}},\,I_{\text{BR2}}\,...$ Nominal current of the motor holding brake on axis 1, axis 2
 - P_{VSLOT} ... Power dissipation of the 8EAC plug-in module
- 4) Maximum cable length between line filter and mains connection on the module.
- 5) Valid for a mains input voltage of 230 VAC.
- The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.
- The value can be higher under certain conditions.
- 7) This value applies to unshielded wiring inside a control cabinet.
 - Maximum length of the DC bus wiring inside a control cabinet.
- 8) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 9) Valid under the following conditions: 325 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 10) The total continuous power of all motor connections is not permitted to exceed 2 kW.
- 11) The temperature specifications refer to the ambient temperature.
- 12) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 13) The total peak power of all motor connections is not permitted to exceed 5 kW.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 15) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) The sum of the length of all motor cables connected to this module is not permitted to exceed this value.
- 18) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified cable length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 20) There is a connection for external braking resistors. An internal braking resistor is available as an option.
- 21) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 22) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

$$I_{max} = f / I_{G} * A * 1/(2*\rho)$$

- f ... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 24) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 25) Output voltage 5.2 V is only available under the following conditions:
 - 8EI servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8EI servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 26) Except encoder type HIPERFACE DSL.
- 27) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 28) I_{ENCODER} ... Current consumption of the encoder
 - $U_{\mbox{\tiny 24V}} \mbox{ ... }$ Input voltage on the +24 VDC input of the module
- 29) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

1.2.3.2 Mains input voltage - 3x 200 to 480 VAC

1.2.3.2.1 Continuous power up to 4 kW (motor connection)

Table 141: 8EI2X2HWDS0.XXXX-1, 8EI4X5HWDS0.XXXX-1, 8EI8X8HWDS0.XXXX-1 - Technical data

1) A line filter must be connected.

CE compliance can only be ensured by connecting a B&R line filter (8x0F...).

In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.

2) P_{AVG} ... Average continuous power of the module

 $I_{\text{AX1}},\,I_{\text{AX2}}\,...$ RMS value of the current on axis 1, axis 2

 $I_{\text{BR1}},\,I_{\text{BR2}}\,...$ Nominal current of the motor holding brake on axis 1, axis 2

 $P_{\text{VSLOT}} \dots Power dissipation of the 8EAC plug-in module$

- 3) P_{AVG} ... Average continuous power of the module
 - $I_{AX1},\,I_{AX2}$... RMS value of the current on axis 1, axis 2
 - $I_{\text{BR1}},\,I_{\text{BR2}}\,...$ Nominal current of the motor holding brake on axis 1, axis 2
 - P_{VSLOT} ... Power dissipation of the 8EAC plug-in module
- 4) Maximum cable length between line filter and mains connection on the module.
- 5) Valid for a mains input voltage of ≥3x 400 VAC.
- The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.
- The value can be higher under certain conditions.
- 7) This value applies to unshielded wiring inside a control cabinet.
 - Maximum length of the DC bus wiring inside a control cabinet.
- 8) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 9) Valid under the following conditions: 560 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 10) The total continuous power of all motor connections is not permitted to exceed 4 kW.
- 11) The temperature specifications refer to the ambient temperature.
- 12) Value for the nominal switching frequency.
- 13) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 14) The total peak power of all motor connections is not permitted to exceed 10 kW.
- 15) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 18) The sum of the length of all motor cables connected to this module is not permitted to exceed this value.
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 20) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified cable length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 21) There is a connection for external braking resistors. An internal braking resistor is available as an option.
- 22) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 23) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 24) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

$$I_{max} = f / I_{G} * A * 1/(2*\rho)$$

- f ... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Q mm²/m] (e.g. for copper: ρ = 0.0178)
- 25) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 26) Output voltage 5.2 V is only available under the following conditions:
 - 8El servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8El servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 27) Except encoder type HIPERFACE DSL.
- 28) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 29) I_{ENCODER} ... Current consumption of the encoder
 - U_{24V} ... Input voltage on the +24 VDC input of the module
- 30) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

1.2.3.2.2 Continuous power 2 x 7 kW to 2 x 9 kW (motor connection)

Wall mounting	258.5 mm (with 8EXA front cover: 261 mm)		
Weight	8 kg		

Table 144: 8EI017HWDS0.XXXX-1, 8EI022HWDS0.XXXX-1 - Technical data

- 1) A line filter must be connected.
 - CE compliance can only be ensured by connecting a B&R line filter (8x0F...).
 - In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.
- 2) Maximum line length between line filter and mains connection on the module.
- 3) Valid for a mains input voltage of ≥3x 400 VAC.
 - The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.
- 4) The value can be higher under certain conditions.
- This value applies to unshielded wiring inside a control cabinet.
 - Maximum length of the DC bus wiring inside a control cabinet.
- 6) Current consumption depends on the respective configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 7) At nominal 24 VDC supply voltage and 20 kHz switching frequency. Without plug-in card.
- 8) Valid under the following conditions: 560 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 9) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.

- 10) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 11) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 12) The sum of the cable lengths of all motor cables connected to this module is not permitted to exceed this value.
- 13) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 14) This values apply to an external braking resistor. This module is not equipped with an internal braking resistor.
- 15) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 16) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 17) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

$$I_{max} = f / I_{G} * A * 1/(2*\rho)$$

- f ... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 18) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 19) Output voltage 5.2 V is only available under the following conditions:
 - 8EI servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8EI servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 20) Except encoder type HIPERFACE DSL.
- 21) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 22) I_{ENCODER} ... Current consumption of the encoder
 - $U_{24V} \dots$ Input voltage on the +24 VDC input of the module
- 23) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

1.2.4 3-axis modules

1.2.4.1 Mains input voltage - 1x 110 to 230 VAC / 3x 200 to 230 VAC

1.2.4.1.1 Order data

Model number	Short description
	3-axis modules SafeMOTION
8EI2X2MWTS0.XXXX-1	ACOPOS P3 servo drive, 1x 110-230 VAC, 3x 200-230 VAC, 3x 2.2 A, SafeMOTION EnDat 2.2, 3 axes, wall mounting

Weight		4 kg	

Table 147: 8EI2X2MWTS0.XXXX-1, 8EI4X5MWTS0.XXXX-1, 8EI8X8MWTS0.XXXX-1 - Technical data

1) A line filter must be connected.

CE compliance can only be ensured by connecting a B&R line filter (8x0F...).

In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.

2) P_{AVG} ... Average continuous power of the module

 $I_{AX1},\,I_{AX2},\,I_{AX3}\,...$ RMS value of the current on axis 1, axis 2, axis 3

 $I_{\text{BR1}},\,I_{\text{BR2}},\,I_{\text{BR3}}\dots$ Nominal current of the motor holding brake on axis 1, axis 2, axis 3

 $P_{\text{VSLOT}} \dots Power dissipation of the 8EAC plug-in module \\$

- 3) Maximum cable length between line filter and mains connection on the module.
- 4) Valid for a mains input voltage of 230 VAC.
 - The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.
- 5) The value can be higher under certain conditions.
- 6) This value applies to unshielded wiring inside a control cabinet.
 - Maximum length of the DC bus wiring inside a control cabinet.
- 7) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.
 - The inrush current of the 24 VDC power supply is not limited by the module.
- 8) Valid under the following conditions: 325 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 9) The total continuous power of all motor connections is not permitted to exceed 2 kW.
- 10) The temperature specifications refer to the ambient temperature.
- 11) Value for the nominal switching frequency.

- 12) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 13) The total peak power of all motor connections is not permitted to exceed 5 kW.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 15) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) The sum of the length of all motor cables connected to this module is not permitted to exceed this value.
- 18) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified cable length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 20) There is a connection for external braking resistors. An internal braking resistor is available as an option.
- 21) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 22) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

$$I_{max} = f / I_G * A * 1/(2*\rho)$$

- f ... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- $I_{\text{G}} \dots$ Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 24) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 25) Output voltage 5.2 V is only available under the following conditions:
 - 8EI servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8EI servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 26) Except encoder type HIPERFACE DSL.
- 27) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 28) I_{ENCODER} ... Current consumption of the encoder
 - $U_{\mbox{\tiny 24V}} \dots$ Input voltage on the +24 VDC input of the module
- 29) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

1.2.4.2 Mains input voltage - 3x 200 to 480 VAC

1.2.4.2.1 Order data

Model number	Short description
	3-axis modules SafeMOTION
8EI2X2HWTS0.XXXX-1	ACOPOS P3 servo drive, 3x 200-480 VAC, 3x 2.2 A,
	SafeMOTION EnDat 2.2, 3 axes, wall mounting
8EI4X5HWTS0.XXXX-1	ACOPOS P3 servo drive, 3x 200-480 VAC, 3x 4.5 A,
	SafeMOTION EnDat 2.2, 3 axes, wall mounting
8EI8X8HWTS0.XXXX-1	ACOPOS P3 servo drive, 3x 200-480 VAC, 3x 8.8 A,

Table 150: 8EI2X2HWTS0.XXXX-1, 8EI4X5HWTS0.XXXX-1, 8EI8X8HWTS0.XXXX-1 - Technical data

1) A line filter must be connected.

CE compliance can only be ensured by connecting a B&R line filter (8x0F...).

In extreme cases, using line filters from 3rd-party manufacturers can result in irreparable damage to the 8EI ACOPOS P3 servo drive.

2) P_{AVG} ... Average continuous power of the module

 $I_{\text{AX1}},\,I_{\text{AX2}},\,I_{\text{AX3}}\dots$ RMS value of the current on axis 1, axis 2, axis 3

 $I_{\text{BR1}},\,I_{\text{BR2}},\,I_{\text{BR3}}\,...$ Nominal current of the motor holding brake on axis 1, axis 2, axis 3

 $P_{\text{VSLOT}} \dots Power dissipation of the 8EAC plug-in module$

- 3) Maximum cable length between line filter and mains connection on the module.
- 4) Valid for a mains input voltage of ≥3x 400 VAC.
 - The sum of the continuous power values on all motor connections and the power of the DC bus connector is not permitted to exceed this value.
- The value can be higher under certain conditions.
- This value applies to unshielded wiring inside a control cabinet.

Maximum length of the DC bus wiring inside a control cabinet.

7) Current consumption depends on the configuration of the ACOPOS P3 8EI servo drive.

The inrush current of the 24 VDC power supply is not limited by the module.

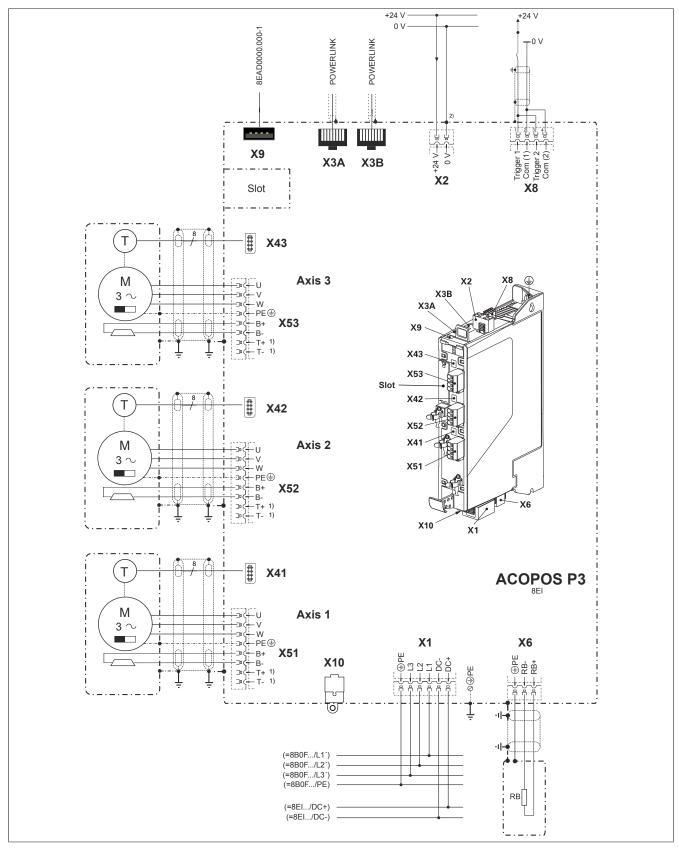

- 8) Valid under the following conditions: 560 VDC DC bus voltage, 5 kHz switching frequency, 40°C ambient temperature, installation elevation <500 m above sea level, no derating due to cooling type.
- 9) The total continuous power of all motor connections is not permitted to exceed 4 kW.
- 10) The temperature specifications refer to the ambient temperature.
- 11) Value for the nominal switching frequency.
- 12) The module cannot supply the full continuous current at this switching frequency. This unusual value for the ambient temperature, at which derating of the continuous current must be taken into account, ensures that the derating of the continuous current can be determined in the same manner as at other switching frequencies.
- 13) The total peak power of all motor connections is not permitted to exceed 10 kW.
- 14) B&R recommends operating the module at its nominal switching frequency. Operating the module at a higher switching frequency for application-specific reasons reduces the continuous current and increases the CPU load.
- 15) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use in accordance with Council Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 16) The module's electrical output frequency (SCTRL_SPEED_ACT * MOTOR_POLEPAIRS) is monitored to protect against dual use per Regulation (EC) 428/2009 | 3A225. If the electrical output frequency of the module exceeds the limit value of 598 Hz uninterrupted for more than 0.5 s, then the current movement is aborted and error 6060 is output ("Power unit: Limit speed exceeded").
- 17) The sum of the length of all motor cables connected to this module is not permitted to exceed this value.
- 18) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified input voltage and wiring. For the operating voltage range of the holding brake, see the user documentation for the motor being used.
- 19) During the project development phase, it is necessary to check if the minimum voltage can be maintained on the holding brake with the specified cable length. For the permissible operating voltage range of the holding brake, see the user documentation for the motor being used.
- 20) There is a connection for external braking resistors. An internal braking resistor is available as an option.
- 21) The encoder type is not predefined from the factory. The encoder type necessary in each case must be configured in Automation Studio.
- 22) The direction of rotation of the encoder can be displayed on the 8EAD0000.000-1 display module.
- 23) The maximum encoder cable length I_{max} can be calculated as follows (the maximum permissible encoder cable length of 75 m is not permitted to exceeded):

$$I_{max} = f / I_{G} * A * 1/(2*\rho)$$

- f ... (Output voltage of encoder interface [V] Min. permissible supply voltage of connected encoder [V]) * 1.1
- I_G ... Max. current consumption of connected encoder [A]
- A ... Cross section of the power supply wires [mm²]
- ρ ... Specific resistance [Ω mm²/m] (e.g. for copper: ρ = 0.0178)
- 24) The output voltage is not predefined from the factory (with the exception of encoder types EnDat 2.2 and HIPERFACE DSL). It must be configured in Automation Studio based on the encoder type. If no output voltage is configured, then the encoder will not be supplied by digital multi-encoder interface X4x. Power to the encoder can then be supplied externally.
- 25) Output voltage 5.2 V is only available under the following conditions:
 - 8El servo drive with 8ZECxxx revision D0 and higher see the device information on the left side cover of the 8El servo drive
 - ACOPOS operating system 3.15.0 and higher (for 8ElxxxxxD... 2-axis modules and 8ElxxxxxT... 3-axis modules)
 - ACOPOS operating system 3.17.0 and higher (for 8ElxxxxxS... 1-axis modules)
- 26) Except encoder type HIPERFACE DSL.
- 27) Values valid for clock output and data input. Except encoder type HIPERFACE DSL.
- 28) I_{ENCODER} ... Current consumption of the encoder
 - U_{24V} ... Input voltage on the +24 VDC input of the module
- 29) The specified degree of protection is only met if either the slot cover is installed on the module or an 8EAC plug-in module is installed and suitable terminals are connected to all connectors and all fans are installed.

1.2.5 Wiring

1.2.5.1 Pinout overview

- 1) A temperature sensor does not need to be connected when using 8ECHxxx hybrid motor cables since the motor temperature is transferred digitally.
- 2) The COM connection on the X2 connector must be grounded to achieve a defined relationship between the signal ground and ground potential!

1.2.5.2 X1 connector - Pinout

Mains voltage 1x 110 to 230 VAC / 3x 200 to 230 VAC

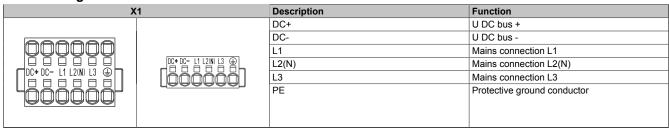

Table 151: Connector X1 - Pinout

Warning!

Only DC bus circuits of 8EI servo drives with the same supply voltage range are permitted to be connected.

Table 155: X4x connector - Pinout

1.2.5.6 Connector X5x - Pinout

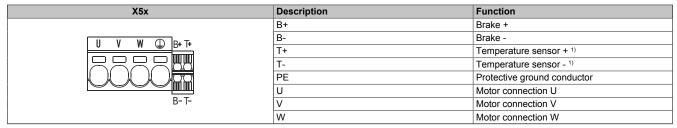

Table 156: Connector X5x - Pinout

1) A temperature sensor does not need to be connected when using a hybrid motor cable solution since the motor temperature is transferred digitally.

Danger!

The connections for the motor temperature sensors and the motor holding brake are safely isolated circuits. These connections are therefore only permitted to be connected to devices or components that have sufficient isolation per IEC 60364-4-41 or EN 61800-5-1.

Information:

B&R recommends wiring the ACOPOS P3 X5x motor connectors in the following order:

- 1. X51
- 2. X52
- 3. X53

1.2.5.7 Connector X6 - Pinout

X6	Description	Function
RB+RB− ⊕	PE	Protective ground conductor
	RB-	Braking resistor -
l läääl	RB+	Braking resistor +

Table 157: Connector X6 - Pinout

Danger!

During operation, the contacts of connector X6 carry dangerous voltages greater than 60 VDC. Touching one of these contacts can result in a life-threatening electric shock. This could result in death or severe injury.

For this reason, terminal block 8TB3103.222A-20 or 8TB4103.222A-10 must always be connected to connector X6 during operation.

1.2.5.8 Connector X8 - Pinout

X8	Pin	Description	Function
<u>at</u>	1	Trigger 1	Trigger 1
	2	COM (1)	Trigger 1 0 V
	3	Trigger 2	Trigger 2
	4	COM (2)	Trigger 2 0 V

Table 158: Connector X8 - Pinout

1.2.5.9 Connector X10 - Pinout

In preparation

1.3 Setting POWERLINK node numbers

ACOPOS P3 8EI servo drives do not have node number switches and are delivered with the node number set to 0. There are 2 ways to set the node number:

- Setting with dynamic node allocation (DNA) in Automation Studio
- Setting with the 8EAD0000.000-1 display module

Information:

If an ACOPOS P3 8EI servo drive is supplied with 24 VDC and its node number is set to 0, then LED "PLK" is lit solid red.

Information:

Node numbers in the range 001 to 239 are permitted.

Node number 000 and in the range 240 to 255 are reserved and not permitted.

Information:

A node number set using the 8EAD0000.000-1 display module is only applied the next time the 24 VDC power supply of the ACOPOS P3 8E1 servo drive is switched back on.

Setting with dynamic node allocation (DNA)

Information:

The node number of the first ACOPOS P3 8EI servo drive in an ACOPOS P3 drive system can only be set using DNA if it is connected via POWERLINK directly to the controller or another POWERLINK-capable module (in DNA mode) that can switch hub ports (e.g. X20BC...).

If this is not the case, the node number of the first ACOPOS P3 8EI servo drive in an ACOPOS P3 drive system can only be set using the 8EAD000.0000-00 display module.

Information:

Setting the node number using DNA only works on ACOPOS P3 8EI servo drives with node number 0 (factory setting).

See also section "Dynamic node allocation (DNA)" in Automation Help.

Setting with the 8EAD0000.000-1 display module

See "Accessories / Display module 8EAD0000.000-1" in the ACOPOS P3 user's manual.

2 Installation

See ACOPOS P3 user's manual MAACPP3-ENG, chapter "Installation".

3 Dimensioning

See ACOPOS P3 user's manual MAACPP3-ENG, chapter "Dimensioning".

4 Wiring

See ACOPOS P3 user's manual MAACPP3-ENG, chapter "Wiring".

Chapter 5 • System characteristics

1 Integrated (network-based) safety technology - SafeMOTION

1.1 General information

1.1.1 ACOPOSmulti SafeMOTION and ACOPOSmotor SafeMOTION

SafeMOTION integrated safety technology is implemented using an integrated SafeMOTION module on ACOPOS-multi inverter modules and the ACOPOSmotor SafeMOTION inverter unit.

One SafeMOTION module is integrated in the safe drive for each safe axis.

A SafeMOTION module is the equivalent of a safe node and performs the safety functions on the drive.

Only 1-axis modules are available for ACOPOSmulti SafeMOTION SinCos.

Information:

ACOPOSmulti SafeMOTION EnDat 2.2

A safe 2-axis module includes two SafeMOTION modules. It is therefore the equivalent of one POWER-LINK node and two safe nodes. This should be taken into consideration when designing the system.

Information:

The user is not able to connect or disconnect the SafeMOTION module! This means that a standard axis (ACOPOSmulti, ACOPOS P3, ACOPOSmotor) cannot be retrofitted!

1.1.2 ACOPOS P3 SafeMOTION

On ACOPOS P3 SafeMOTION servo drives, SafeMOTION integrated safety technology is implemented as an integrated option.

On ACOPOS P3 servo drives, up to 3 axes are integrated in a SafeMOTION module.

An ACOPOS P3 SafeMOTION servo drive corresponds to a safe node (regardless of the number of axes integrated in a SafeMOTION module) and executes the safety function on the drive.

Information:

The user is not able to connect or disconnect the SafeMOTION module! This means that a standard axis (ACOPOSmulti, ACOPOS P3, ACOPOSmotor) cannot be retrofitted!

261

1.2 Safety functions

The following safety functions are supported by the SafeMOTION module:

Safety function	ACOPO SafeMO		EN ISO 13849-1		EN 61508 / EN 6200	61	Safe Encoder
	EnDat 2.2	SinCos	EnDat 2.2	SinCos	EnDat 2.2	SinCos	evaluation Necessary
	Starting ty Rel						,
Safe Torque Off (STO)	R 1.3	R 1.4	PL e / Cat. 4	PL e / Cat. 4	SIL 3	SIL 3	No
Safe Torque Off One Channel (STO1)	R 1.3	R 1.4	PL d / Cat. 3	PL d / Cat. 3	SIL 2	SIL 2	No
Safe Operation Stop (SOS)	R 1.3	R 1.4	PL d / Cat. 3	Max. PL e / Cat. 4, depends on the en- coder used	SIL 2	Max. SIL 3, Depends on the encoder used	Yes

Table 161: ACOPOS P3 SafeMOTION: Safety functions and associated safety levels

- 1) Safe encoder evaluation is not necessary in conjunction with SSO.
- 2) Supported in hardware upgrade 1.10.2.x and later in conjunction with SSO.

For details about the individual safety functions, see section 6 "Safety technology" on page 279.

2 Integrated safety technology

Seamless integration of safety technology in the standard application is a reality with B&R's safety technology products. This allows fixed wiring to be replaced by safe data transfer via the existing machine bus system. Flexibly configured or programmed safety behavior can be adapted optimally to various safety situations. Complete diagnostic information about safety components accessible via the machine bus system provides detailed data about the state of the machine.

Insufficient protection from manipulation and the inadequacy of existing safety solutions provide some justification for dangerous behavior when it comes to operating the machine. The possibilities provided by the latest safety technology allow considerable potential for improvement here. In the pursuit of improving machine safety, safety technology guidelines are continually updated according to the current technological situation. Consequently, improvements become mandatory. B&R's integrated safety technology is state-of-the-art and meets both current and expected future demands on safety components.

Safety shutdowns do not always have to involve a full machine stop. When opening a protective cover, it is often sufficient to reduce the speed. Smart, safe reactions to various situations provide safety without having to stop the production process. The machine does not need to be emptied and set up again, and manipulation is not necessary. This results in real advantages for the user that can be implemented with programmable safety behavior.

Integrated safety technology products are certified for use in safety applications up to:

- EN ISO 13849, PL e / Cat. 4
- IEC 62061, SIL 3
- IEC 61508, SIL 3
- IEC 61511, SIL 3

The actual level of safety achieved depends on the respective safety function and the components being used!

A cycle time of 400 µs for SIL 3 SafeMOTION safety applications is a new dimension for safe communication. Response times decrease by a factor of 10, and the advantages of hard-wired solutions are combined with the possibilities of advanced, integrated and intelligent safety bus technology. POWERLINK and openSAFETY accomplish all this using only standard Ethernet mechanisms. As a result, these protocols can be combined with all conventional and, more important, newer Ethernet profiles. openSAFETY is the fastest and most flexible real-time safety bus system on the market.

The reduction to a single cable allows safety-related data to be transferred using the existing infrastructure. Additional cabling of a safe line is not necessary. Transparent and non-reactive access of secure data is an integral part of functional machine control. Complicated communication mechanisms between the safety application and standard application are also no longer necessary. Smart, safe reactions instead of hard machine stops provide advantages for processes, help to avoid manipulation and therefore increase the value of machines.

System characteristics • Integrated safety technology

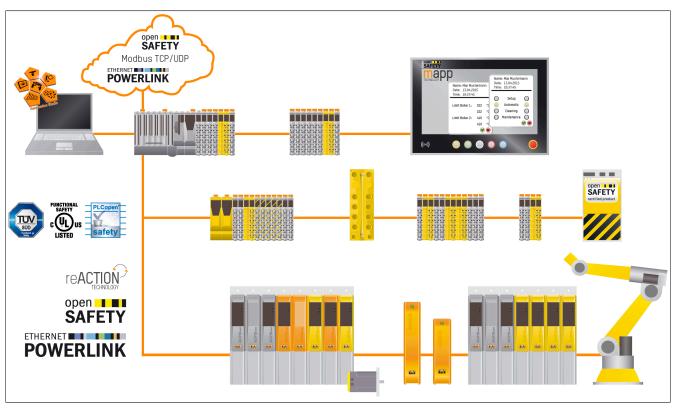

Figure 55: Integrated safety technology - Topology

3 System requirements

Integrated safety technology requires the use of the following software and hardware:

- POWERLINK V2
- Automation Studio V3.0.80 or higher
- Automation Studio V4.2.5.x or higher (Safety Release 1.10 or later)
- · Automation Runtime V3.00 or higher
- ACP10 software V2.180 or higher (for Safety Release R1.3 ACOPOSmulti SafeMOTION EnDat 2.2)
- ACP10 software V2.250 or higher (starting with Safety Release R1.3 ACOPOSmulti SafeMOTION EnDat 2.2)
- ACP10 software V2.391 or higher (starting with Safety Release R1.3 ACOPOSmulti SafeMOTION SinCos)
- ACP10 software V2.480 or higher (ACOPOSmulti SafeMOTION Safety Release R1.9 or later)
- ACP10 software V3.140 or higher (Safety Release 1.10 ACOPOSmotor SafeMOTION or later)
- ACP10 software V3.161 or higher (Safety Release 1.10 ACOPOS P3 SafeMOTION or later)
- ACP10 software V5.040 or higher (hardware upgrade 1.10.2 ACOPOS P3 SafeMOTION or later)
- ACP10 software V5.051 or higher (hardware upgrade 1.10.2 or later if library "SafeMC" is required for safe machine options)
- SG4 CPUs

4 System limits

The following limitations exist when using SafeMOTION modules:

- A SafeMOTION module basically corresponds to a safe node²⁾. Additionally, each drive module equates
 to one POWERLINK node.
- A SafeMOTION module can only communicate safely with one (1) SafeLOGIC controller with SafeMOTION support (see SafeLOGIC data sheets X20SL80xx, X20SL81xx and X20SLXx10 on www.br-automation.com). It is not possible for a SafeMOTION module to communicate safely with multiple SafeLOGIC controllers or with other safe modules (other SafeIO, SafeMOTION, etc.).
- The output-side payload data size of the SafeLOGIC controller is limited to 1490 bytes. Among other things, this limitation reduces the resulting number of usable SafeIO or SafeMOTION modules during SafeLOGIC-to-SafeLOGIC communication.
- The safe state is implemented in B&R safety modules by cutting off the output. This is a design feature of the modules and cannot be changed.
 - This is particularly important for SafeMOTION modules since the safe state cuts off the torque on the motor!

Danger!

After the safe state (STO) is activated or in state FAIL SAFE, the drive is not supplied with power; the motor therefore no longer exerts torque or force.

If the motor was moving before STO is activated, it is only stopped by a safe motor holding brake (if available) or by the friction of the complete system!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Danger!

The safety response time must be taken into consideration since this has a substantial effect on the residual distances and remaining times to be considered!

In order to calculate the total safety response time, the user must validate the rundown time of the complete system! For the switch-off time, see 5 "Safety response time" on page 267.

²⁾ ACOPOSmulti SafeMOTION inverter modules: A SafeMOTION module is integrated into a single-axis inverter module, i.e. one safe node. A 2-axis inverter module has two integrated SafeMOTION modules, i.e. two safe nodes.

5 Safety response time

The safety response time is the time between the arrival of the signal on the input channel and the output of the cutoff signal on the output.

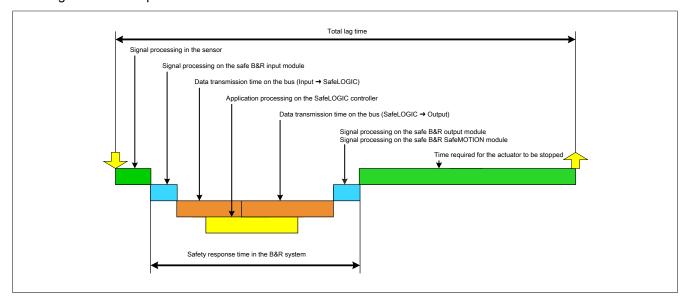

Figure 56: Total lag time

As illustrated in the figure, the safety response time in the B&R system is composed of the following partial response times:

- · Signal processing on the safe B&R input module
- Data transmission time on the bus (Input → SafeLOGIC)
- Data transmission time on the bus (SafeLOGIC → Output)
- Signal processing in the safe B&R output module (or safe B&R SafeMOTION module)

Danger!

The following sections are dedicated exclusively to the safety response time in the B&R system. When assessing the complete safety response time, the user must include signal processing in the sensor as well as the time until the actuator is stopped.

Be sure to validate the total lag time on the system!

Information:

The safety response time in B&R products already contains all delays caused by sampling input data (sampling theorem).

5.1 Signal processing on the safe B&R input module

The maximum I/O update time in the "I/O update time" chapter for the respective module must be taken into account when processing signals in the safe B&R input module.

5.2 Data transmission time on the bus

The following relationship must be taken into consideration for the data transmission time on the bus:

- The time needed to transfer data from the input to the SafeLOGIC controller or to the output depends on the sum of the cycle times and CPU copy times in effect on the transfer line.
- POWERLINK MN (managing node, standard CPU) settings are important for the actual timing on the bus, but they cannot be used from a safety point of view since the values can be changed at any time in the course of modifications made outside of the safety application.
- In the SafeLOGIC controller, data transmission times are monitored on the bus using openSAFETY services. The time needed to process the application on the SafeLOGIC controller is taken into account in this test (system-dependent). Monitoring is defined in SafeDESIGNER using the parameters in parameter group "Safety Response Time".

Information:

The safety components located in this network segment could be cut off by the SafeLOGIC controller if modified parameters on the POWERLINK MN alter the data transmission times on the bus so that they lie outside of the SafeDESIGNER parameters defined in parameter group "Safety Response Time".

Information:

The safety components located in this network segment could be cut off by the SafeLOGIC controller if EMC disturbances cause data failures that fall outside of the SafeDESIGNER parameters defined in parameter group "Safety Response Time".

Calculating the maximum data transmission time - up to Release 1.9:

- The total max. data transmission time on the bus is calculated by adding parameter "Worst_Case_Response_Time_us" for the safe input module and parameter "Worst_Case_Response_Time_us" for the safe output module. When doing this, be sure to check parameter "Manual_Configuration". If parameter "Manual_Configuration" is set to "No", the value specified for parameter "Default Worst Case Response Time us" is used.
- Special case: Local inputs on the X20SLX module:

 The total max. data transmission time on the bus is calculated by adding parameter "Cycle_Time_max_us" + 2000 µs and parameter "Worst_Case_Response_Time_us" for the safe output module. When doing this, be sure to check parameter "Manual_Configuration". If parameter "Manual_Configuration" is set to "No", the value specified for parameter "Default_Worst_Case_Response_Time_us" is used.

Calculating the maximum data transmission time - Release 1.10 and later:

The following parameters are relevant for calculating the data transmission time between the safe input module and safe output module; parameter "Manual Configuration" deserves special attention.

- Relevant parameters for "Manual Configuration = No":
 - "PacketLoss1": Parameter "Default Additional Tolerated Packet Loss" of group "Safety Response Time Defaults" of the SafeLOGIC controller
 - "DataDuration1": Parameter "Default Safe Data Duration" of group "Safety Response Time Defaults" of the SafeLOGIC controller
 - "NetworkSyncCompensation1": 12 ms
 - "PacketLoss2": Same as "PacketLoss1"
 - "DataDuration2": Same as "DataDuration1"
 - "NetworkSyncCompensation2": Same as "NetworkSyncCompensation1"
- Relevant parameters for "Manual Configuration = Yes":
 - "PacketLoss1": Parameter "Additional Tolerated Packet Loss" of group "Safety Response Time" of the safe input module
 - "DataDuration1": Parameter "Safe Data Duration" of group "Safety Response Time" of the safe input module
 - "NetworkSyncCompensation1": 12 ms
 - "PacketLoss2": Parameter "Additional Tolerated Packet Loss" of group "Safety Response Time" of the safe output module
 - "DataDuration2": Parameter "Safe Data Duration" of group "Safety Response Time" of the safe output module
 - "NetworkSyncCompensation2": Same as "NetworkSyncCompensation1"
- Special case: Local inputs on the X20SLX module:
 - "PacketLoss1": 0
 - "DataDuration1": Parameter "Cycle Time max" of group "Module Configuration" of the X20SLX + 2000 µs
 - "NetworkSyncCompensation1": 0 ms
- Special case: Local outputs on the X20SLX module:
 - "PacketLoss2": 0
 - "DataDuration2": Parameter "Cycle Time max" of group "Module Configuration" of the X20SLX + 2000 μs
 - "NetworkSyncCompensation2": 0 ms
- Special case: Linking local inputs with local outputs on the X20SRT module:
 - "PacketLoss1": 0
 - "PacketLoss2": 0
 - "DataDuration1": Parameter "Cycle time" of group "General"
 - "DataDuration2": Parameter "Cycle time" of group "General"
 - "NetworkSyncCompensation1": 0 ms
 - "NetworkSyncCompensation2": 0 ms

The following equation is used to calculate the maximum data transmission time between the safe input module and safe output module:

Maximum data transmission time = (PacketLoss1+1)* DataDuration1 + NetworkSyncCompensation1 + (PacketLoss2+1)* DataDuration2 + NetworkSyncCompensation2

Information:

In addition to the data transmission time on the bus, the time for signal processing in the safe B&R input and output module must be taken into account (see section "Safety response time").

Information:

For more information about the actual data transmission time, see Automation Help, section Diagnostics and service -> Diagnostics tools -> Network analyzer -> Editor -> Calculation of safety runtime. The cycle time of the safety application must also be added.

5.3 Signal processing on the safe B&R output module

The maximum I/O update time in the "I/O update time" chapter for the respective module must be taken into account when processing signals in the safe B&R output module.

5.4 Signal processing on the safe B&R SafeMOTION module

The duration of signal processing in the event of a function request depends on the drive module, see Tab. 162 "Error response times" on page 271.

In addition to the signal processing, however, the duration of the communication between the POWERLINK interface and the SafeMOTION module must also be taken into account. In the worst case, this can be 1600 μ s.

Safe error response time

In addition to the signal processing duration in functional situations, the safe error response time is also relevant when setting up safety equipment.

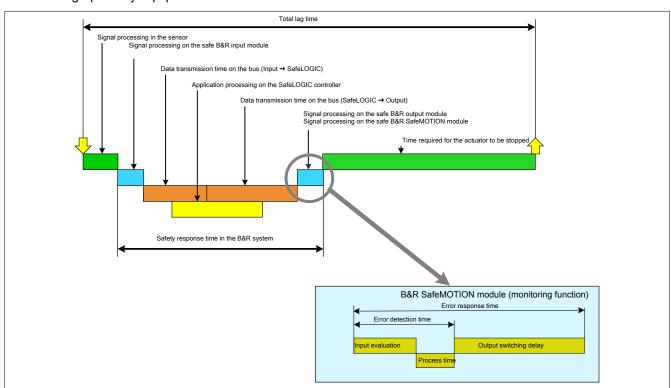

Figure 57: Safe error response time

The safe error response time plays a role if the currently monitored limit is exceeded when a safety function is activated on the SafeMOTION module.

The safe error response time includes:

- Error detection time (input evaluation + process time on the SafeMOTION module)
- · Output switching delay

	ACOPOSmulti EnDat 2.2	ACOPOSmulti SinCos	ACOPOSmotor	ACOPOS P3 - 1	ACOPOS P3 -2/3
Process time (functions except SLT) [µs]	800	800	800	800	1600
Process time SLT (SLT) [µs]	=	=	-	200	400
Input evaluation (position) [μs]	200 + Process time	200 + Process time	200 + Process time	200 + Process time	200 + Process time
Input evaluation (speed) [µs]	200 + Process time * 1.5	200 + Process time * 1.5	200 + Cycle * 1.5	200 + Process time * 1.5	200 + Process time * 1.5
Input evaluation (speed with SSO) [µs]	-	-	-	900 + Process time * 2.5	900 + Process time * 2.5
Input evaluation (torque) [μs]	-	-	-	400 + Process time SLT * 2	400 + Process time SLT * 2
Output switching delay (pulse disabling) [µs]	5000	5000	5000	2000	2000
Output switching delay (brake output) [µs]	0	0	0	0	0

Table 162: Error response times

SafeMOTION User's Manual V 4.6.1

System characteristics • Safety response time

	ACOPOSmulti EnDat 2.2	ACOPOSmulti SinCos	ACOPOSmotor	ACOPOS P3 - 1	ACOPOS P3 -2/3

Error response time (worst case) [µs]	7200	7200	7200	4200	6200
Error response time (SSO worst case) [µs]	-	-	-	5700	8500

Table 162: Error response times

Danger!

For the worst-case safe error response time on the SafeMOTION module, see Tab. 162 "Error response times" on page 271.

When setting up the safety measures, the assumption must be that the drive will accelerate to its maximum within this amount of time.

This speed must be considered together with the speed when the safety function is violated in order to determine the maximum possible speed when coasting to a stop!

In addition, the error response time for determining the residual distance must be used when an error occurs in order to determine the maximum distance by which a monitored position limit can be exceeded!

Danger!

For the worst-case safe error response time on the SafeMOTION module, see Tab. 162 "Error response times" on page 271.

For the design of safety equipment, it must be assumed that limitation of the torque for the drive cannot be ensured within this time.

The resulting achievable change in angular momentum must be determined in a risk analysis and is not permitted to result in any hazard!

I/O update time

For the I/O update times of the safe B&R SafeMOTION module, see Tab. 163 "Maximum I/O update time" on page 273 for all drive modules.

Term definition

I update time Time until the encoder data is on the bus to the SL controller (when using the position/speed in the SL

controller)

O update time Time until the data from the bus results in a reaction (time until a requested STO on the module is triggered)

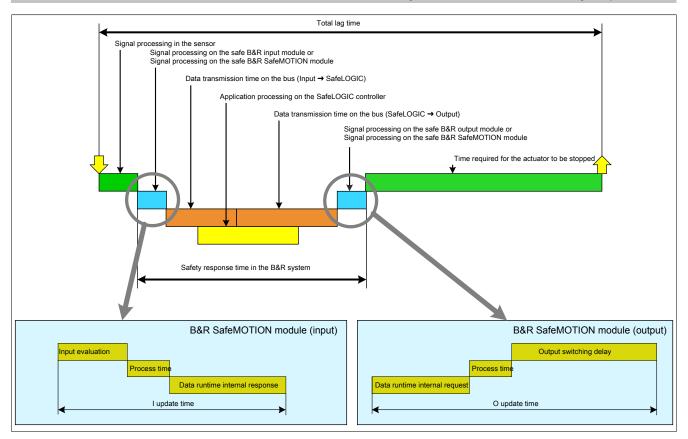

Figure 58: I/O update times

	ACOPOSmulti EnDat 2.2	ACOPOSmulti SinCos	ACOPOSmotor	ACOPOS P3 - 1	ACOPOS P3 -2/3
Data runtime internal request [µs]	1200	1200	1200	1250	1250
Data runtime internal response [µs]	1600	1600	1600	1550	1550
I update time (position) [μs]	3400	3400	3400	3350	4950

Table 163: Maximum I/O update time

5.5 Calculating the safety response time

Information:

The information in this section applies only up to SafeDESIGNER 4.1.x.

The safety response time can be calculated using the Response Time Calculator. This tool can be opened with "Project \rightarrow Response Time Calculator".

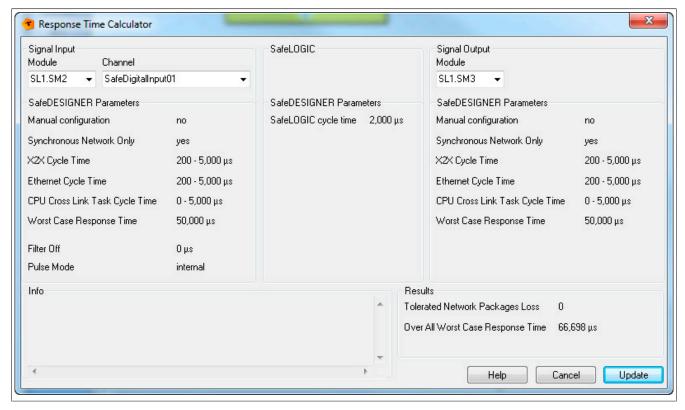

Figure 59: Response Time Calculator

This tool takes the values set in SafeDESIGNER and uses them to calculate the total response time and the tolerated packet loss on the network.

The modules relevant for the calculation can be selected in the "Signal input" and "Signal output" section. The values that are set accordingly are automatically shown in SafeDESIGNER and the total response time is calculated.

If the values set in SafeDESIGNER for the response time calculation result in a longer maximum response time than is set in SafeDESIGNER, the calculation is canceled and the error is shown in the "Info" field.

SafeDESIGNER parameters can also be changed with the dialog box window open. The values are applied either after changing which inputs/outputs are selected or after updating using the "Refresh" button.

Input fields:

Input field	Value	Function	Corresponding SafeDESIGNER parameters
Synchronous network only	Yes	All networks involved in data transfer are synchronous.	Synchronous_Network_Only = Yes
	No	At least one of the networks involved in data transfer is not synchronous.	Synchronous_Network_Only = No
X2X cycle time	200-30,000 μs	X2X cycle time entry for checking the data transmission time on the SafeLOGIC controller	Min_X2X_CycleTime_us Max_X2X_CycleTime_us
Ethernet cycle time	200-30,000 μs	POWERLINK cycle time entry for checking the data transmission time on the SafeLOGIC controller	Min_Powerlink_CycleTime_us - Max_Powerlink_CycleTime_us
CPU cross link task cycle time	0-30,000 µs	Cycle time entry of the CPU cross link task for checking the data transmission time in the SafeL-OGIC controller. See the table below.	Min_CPU_CrossLinkTask_CycleTime_us - Max_CPU_CrossLinkTask_CycleTime_us
Response time	3000-500,000 μs	Limit value for monitoring the data transmission time on the bus	Worst_Case_Response_Time_us
Filter off	0	A switch-off filter is not being used on the input module.	Filter_Off_us
	1-500,000 µs	A switch-off filter is being used on the input module.	
Pulse mode	External	"External pulse signals" mode is being used on the input module.	Pulse_Mode = External
	Internal	"Internal pulse signals" mode is being used on the input module.	Pulse_Mode = Internal
	None	"External pulse signals" mode is not being used on the input module.	Pulse_Mode = No pulse
SafeLOGIC cycle time	800-20,000 μs	SafeLOGIC cycle time parameter "Cycle_Time_us" from SafeDESIGNER in μs.	Cycle_Time_us

Table 164: Fields in the "Response Time Calculator"

If the SafeLOGIC controller is on a different POWERLINK interface than the SafeIO modules, then the data must be copied to the CPU on its way from the SafeIO modules to the SafeLOGIC controller. An internal system task (CPU_CrossLinkTask) handles this copy procedure. The cycle time of this task is automatically assigned by the system.

It is important to know the configuration options of CPU_CrossLinkTask for monitoring data transmission time on the SafeLOGIC controller:

Min. CPU cross link task	Max. CPU cross link task	Description
Value > 0	Value > 0	Data is always copied via the CPU. Application situations where data is not copied are detected
		by the SafeLOGIC controller and registered as errors due to the very short runtime.
Value > 0	0	Not a valid combination
No	Value > 0	Runtime monitoring in the SafeLOGIC controller accepts application situations where data is
		copied as well as application situations where it is not.
0	0	Data is never copied via the CPU. Application situations where data is copied are detected by
		the SafeLOGIC controller and registered as errors due to the very long runtime.

Table 165: Meaning of "Min./Max. CPU" parameters

Output fields:

Output field	Value	Function	Corresponding SafeDESIGNER parameters
Tolerated network	0-10	Number of lost packets that are tolerated without	-
packages loss		cutting off the safety function	
Total response time		Resulting safety response time in the B&R system.	-

Table 166: Output fields in the "Response time calculator"

5.6 Parameters for the safety response time in SafeDESIGNER

The parameters for the safety response time are generally configured in the same way for all stations involved in the application. For this reason, these parameters are configured for the SafeLOGIC controller in SafeDESIGNER.

For application situations in which individual safety functions require optimal response time behavior, the parameters for the safety response time can be configured individually on the respective module.

The parameters and their limits for the SafeMOTION module are described below for each specific module.

Up to SafeDESIGNER 4.1.x:

Parameter		Description	Default value	Unit		
Manual_Configuration	This parameter makes safety response time for	it possible to manually and individually configure the the module.	No	-		
	same way for all station parameters are configured For application situation response time behavior	safety response time are generally configured in the ns involved in the application. For this reason, these red for the SafeLOGIC controller in SafeDESIGNER. 		ot critical to safety functionality. The time for safely cut- is determined independently of this.			

Table 168: SafeDESIGNER parameters: Safety Responsetime

5.7 Minimum signal lengths

The parameters in group "Safety Response Time" in SafeDESIGNER influence the maximum number of data packets that are permitted to fail without triggering a safety response. These parameters therefore act like a switch-off filter. If several data packets are lost within the tolerated amount, safety signals may not be detected if their low phase is shorter than the determined data transmission time.

Danger!

Lost signals can result in serious safety errors. Check all signals to determine the smallest possible pulse length and make sure that it is larger than the determined data transmission time.

Suggested solution:

- The switch-on filter can be used to extend the low phase of a signal on the input module.
- Low phases of signals from the SafeLOGIC controller can be lengthened with restart interlock functions or timer function blocks.

6 Detecting errors within the module

The red "SE" LED makes it possible to evaluate the following error states:

- Module error, e.g. defective RAM, defective CPU, etc.
- · Overtemperature/Undertemperature
- · Overvoltage/Undervoltage
- Incompatible firmware version
- · Incorrect configuration

Errors that occur within the module are detected with the diagnostic coverage (DC) specified in the respective safety function in accordance with the requirements of the standards listed in the certificate. After this occurs, the module reverts back to a safe state within the safe error response time.

The internal module tests needed for this are only performed, however, if the module's firmware has been booted and the module is in either the PREOPERATIONAL state or the OPERATIONAL state. If this state is not achieved (for example, because the module has not been configured in the application), then the module will remain in the boot state.

The boot state is clearly indicated by the following SE LED blink sequences:

Danger!

Operating the safety module in boot mode is not permitted.

Danger!

A safety-related output channel is only permitted to be switched off for a maximum of 24 hours. The channel must be switched on by the end of this period so that the module's internal channel test can be performed.

Chapter 6 • Safety technology

1 Integrated safety technology - SafeMOTION

1.1 General information

The safety functions integrated in the drive open up entirely new possibilities for guaranteeing the safety of personnel while maintaining maximum machine availability.

ACOPOSmulti SafeMOTION inverter modules, ACOPOS P3 SafeMOTION servo drives and ACOPOSmotor SafeMOTION with integrated safety technology round off the B&R safety concept and make it possible to design an entire safety application using state-of-the-art products from B&R.

Information:

Due to the internal cycle time on the ACOPOSmulti SafeMOTION, the POWERLINK cycle time must be set to 400 µs or a whole-number multiple of 400 µs.

The products are intended for use worldwide, in the following areas for example:

- · Automotive industry
- Electrical industry
- Beverages industry
- Food industry
- · Glass and cement building materials industry
- · Handling robotics industry
- Metal industry
- · Packaging industry
- · Paper printing industry
- · Pharmaceutical industry
- · Plastics industry
- · Textile industry
- · Transport systems
- Wood handling and processing industry

This list shows typical areas of application but is by no means complete.

Danger!

B&R drive systems and servo motors have been designed, developed and manufactured for conventional use in industrial environments. They were not designed, developed and manufactured for any use involving serious risks or hazards that could lead to death, injury, serious physical impairment or loss of any kind without the implementation of exceptionally stringent safety precautions.

In particular, these risks include the use of these devices to monitor nuclear reactions in nuclear power plants, in flight control or flight safety systems as well as in the control of mass transportation systems, medical life support systems or weapons systems.

SafeMOTION User's Manual V 4.6.1

1.2 Safe power transmission system

The main components of a safe power transmission system are the safe inverter module or servo drive, the encoder cable, the motor cable and a motor with a position encoder that meets the requirements for use in integrated safety technology.

The following components are permanently installed:

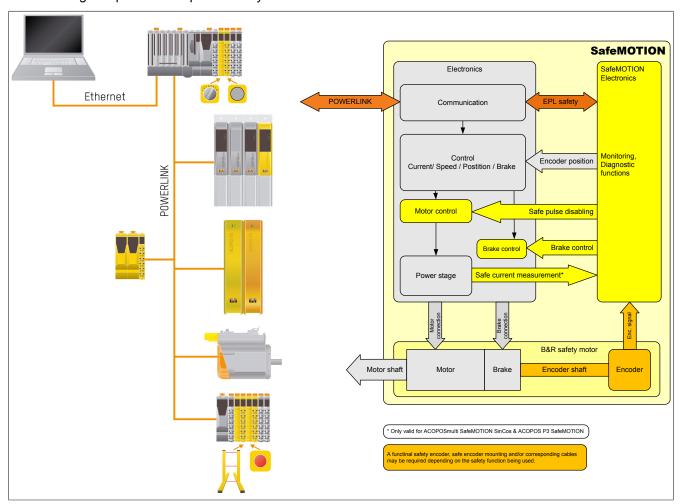

Figure 60: Safe power transmission system

Safe drive module

The safe drive module basically consists of a standard module with additional SafeMOTION hardware and firmware.

SafeMOTION integrated safety technology is implemented using an integrated SafeMOTION module on ACOPOS-multi inverter modules and the ACOPOSmotor SafeMOTION inverter unit.

One SafeMOTION module is integrated in the safe drive for each safe axis. A safe 1-axis module includes one permanent installed SafeMOTION module and is the equivalent of one POWERLINK node and one safe node.

With ACOPOSmulti SafeMOTION EnDat 2.2, a 2-axis module contains two permanently installed SafeMOTION modules and corresponds to one POWERLINK node and two safe nodes.

On ACOPOS P3 SafeMOTION servo drives, SafeMOTION integrated safety technology is implemented as an integrated option. On ACOPOS P3 servo drives, up to 3 axes are integrated in a SafeMOTION module. An ACOPOS P3 SafeMOTION servo drive corresponds to a safe node (regardless of the number of axes integrated in a SafeMOTION module).

As before, actual control is performed via the standard application and is not safety-related. The additional SafeMOTION components provides safety-related monitoring of predefined limits based on requirements, however. If these limits are exceeded, the SafeMOTION module activates safe pulse disabling and the motor holding brake output is switched to 0 V.

1.2.1 ACOPOSmulti SafeMOTION EnDat 2.2 and ACOPOS P3 SafeMOTION

Motor with safe position encoder

In order to be able to use all safety functions, the use of an EnDat 2.2 functional safety encoder from Heidenhain is mandatory! With standard EnDat 2.2 encoders, only the STO, SBC and time-monitored SS1 safety functions are available!

B&R safety motors (Sx, D4/D5, D8/D9, DA/DB, Z8/Z9 encoder option)

For motors with the Sx, D4/D5, D8/D9, DA/DB, Z8/Z9 encoder option, the EnDat 2.2 functional safety encoder is installed in strict accordance with Heidenhain's installation guidelines.

In this way, encoder slippage or encoder shaft breakage can be ruled out as a mechanical error.

Danger!

Encoders used with B&R safety motors (Sx, D4/D5, D8/D9, DA/DB,Z8/Z9 encoder option) are only permitted to be replaced by B&R!

If the encoder is replaced by someone other than B&R, it is no longer permitted to assume that mechanical errors such as encoder slippage or shaft breakage can be ruled out.

B&R standard motors (B8/B9, D0/D1 encoder option)

For motors with the B8/B9, D0/D1 encoder option, the SafeMOTION module can sufficiently detect encoder slippage or encoder shaft breakage in some applications. In this case, the application must meet all requirements specified under 2.3.3.3 "Encoder mounting without proof of fatigue strength - Safe lag error monitoring" on page 306 and all limitations listed in this section must be taken into account. Under these conditions, B&R standard motors can also be used for safety applications!

Combining B&R motors with gearboxes

Danger!

When combining B&R motors with gearboxes, the mechanical connection between the motor and gearbox does not meet "functional safety" requirements. It is not possible to rule out slippage or breakage.

For combinations of B&R motors and gearboxes, only safety functions in which no safe absolute position is monitored are permitted to be used (STO, SBC, SOS, SS1, SS2, SLS, SMS, SLI, SDI, SLA, SBT (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION), SLT (only available for ACOPOS P3 SafeMOTION), and Safe Speed).

The use of B&R motor-gearbox combinations is <u>not</u> permitted with <u>hanging loads and other comparable applications</u> where breakage between the motor and gearbox would result in a dangerous situation!

Encoder cable

ACOPOSmulti SafeMOTION EnDat 2.2

The encoder cable is connected to the SafeMOTION module with a male DSUB connector. Please note the instructions in the "Cable connection via male DSUB connector" section under 6.1.3.1 "Wiring / General information / Connection diagrams for ground and shield connections / 8BVI inverter modules with SafeMOTION (1-axis modules)" on page 155.

Information:

Only B&R 8BCF EnDat 2.2 cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the encoder interfaces!

ACOPOS P3 SafeMOTION EnDat 2.2

The encoder cable is connected to the SafeMOTION module with using a mini I/O connector. See ACOPOS P3 user's manual MAACPP3-ENG, chapter "Wiring".

Information:

Only 8ECF EnDat 2.2 cables from B&R or 8ECH hybrid motor cables from B&R are permitted to be connected to the encoder interfaces!

Motor cable

The motor cable is connected to the safe inverter module with a male motor connector.

ACOPOSmulti SafeMOTION EnDat 2.2

Information:

Only B&R 8BCM motor cables or B&R 8BCH hybrid motor cables are permitted to be used for wiring the motor connections!

ACOPOS P3 SafeMOTION EnDat 2.2

Information:

Only 8ECM motor cables from B&R or 8ECH hybrid motor cables from B&R are permitted to be wired to the motor connections!

1.2.2 ACOPOSmulti SafeMOTION SinCos

Available safety functions

In order to use all of the available safety functions, the encoders used must meet the requirements listed in section 2.3.2.2.1 "Safety requirements for SinCos measuring instruments" on page 296. Note that fault exclusion is required for encoder slippage and encoder shaft breakage and that the encoder installation must therefore be evaluated accordingly.

If encoder slippage or encoder shaft breakage is covered only by the lag error monitoring performed by the SafeMOTION module, then the safety-related use of the Safe Homing, SLP and SMP safety functions is not permitted!

Compatible B&R standard motors (Ex encoder option)

For B&R standard motors, the SafeMOTION module can sufficiently detect encoder slippage or encoder shaft breakage in some safety applications. In this case, the safety application must meet all of the requirements specified under 2.3.3.3 "Encoder mounting without proof of fatigue strength - Safe lag error monitoring" on page 306, and all limitations listed in this section must be taken into consideration. Under these conditions, B&R standard motors can be used for safety applications.

· Encoder cable and encoder

The encoder cable is connected to the SafeMOTION module with a male DSUB connector. Please note the instructions in the "Cable connection via male DSUB connector" section under 6.1.3.1 "Wiring / General information / Connection diagrams for ground and shield connections / 8BVI inverter modules with SafeMOTION (1-axis modules)" on page 155.

The following encoder types are used with B&R standard motors with encoder options E0/E1, E4/E5 and E6/E7:

Heidenhain ECN 1313, EQN 1325, ECN 1113, EQN 1125 (for details, see 1.2.4 "B&R motors / List of encoders / SinCos measuring instruments" on page 283)

Information:

Only B&R 8BCS encoder cables or B&R 8BCE encoder cables are permitted to be used for wiring the encoder interfaces!

· Motor cable

The motor cable is connected to the safe inverter module with a male motor connector.

Information:

Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

Third-party motors

Note the requirements for encoders and motors listed in section 2.3.2.2 "Sine-Cosine encoders" on page 296. Under these conditions, third-party motors can be used for safety applications.

· Encoder cables and encoders

The encoders used must meet the requirements set forth in 2.3.2.2.1 "Safety requirements for SinCos measuring instruments" on page 296, in particular those listed under "EMC requirements for the SinCos measuring instrument " on page 299.

In addition, the wiring from the inverter module to the motor and within the motor itself must be comparable to that of B&R cables and B&R motors. If not, it must be subjected to a complete type examination with the increased test levels specified in IEC 61326-3-1!

Information:

If cables from other manufacturers are used, make sure that they have the same wave parameters and the same design as the respective B&R cable. If deviations exist, additional measures are necessary to ensure that EMC directives are met. When using cables from other manufacturers, B&R cannot guarantee adherence to EMC limit values! The connectors on the cables as well as on the motors are part of a properly functioning EMC concept!

For details, see the ACOPOSmulti user's manual (MAACPM-ENG) under "Technical data / Cables".

Motor cable

The motor cable is connected to the safe inverter module with a male motor connector.

Information:

Only 8BCM motor cables from B&R are permitted to be connected to the motor connectors.

1.2.3 ACOPOSmotor SafeMOTION EnDat 2.2

Motor with safe position encoder

In order to use the safety functions, an EnDat 2.2 functional safety encoder from Heidenhain is a fixed component of the ACOPOSmotor. It is installed strictly according to the guidelines provided by Heidenhain.

In this way, encoder slippage or encoder shaft breakage can be ruled out as a mechanical error.

Combining ACOPOSmotor SafeMOTION with gearboxes

Danger!

When combining ACOPOSmotor SafeMOTION with gearboxes, the mechanical connection between the motor and gearbox does not meet "functional safety" requirements. It is not possible to rule out slippage or breakage.

For combinations of ACOPOSmotor SafeMOTION and gearboxes, only safety functions in which no safe absolute position is monitored are permitted to be used (STO, SBC, SOS, SS1, SS2, SLS, SMS, SLI, SDI, SLA, SBT (only available for ACOPOSmulti SafeMOTION SinCos) and Safe Speed).

The use of ACOPOSmotor SafeMOTION and gearbox combinations is <u>not</u> permitted with <u>hanging loads</u> <u>and other comparable applications</u> where breakage between the motor and gearbox would result in a dangerous situation!

Information:

ACOPOSmotor SafeMOTION modules with gearbox mounting are not available.

1.2.4 B&R motors / Encoder list

This list contains the encoders that have been tested for safe evaluation of ACOPOSmulti SafeMOTION EnDat 2.2 inverter modules and ACOPOS P3 SafeMOTION servo drives from B&R and are therefore approved by B&R for use.

Table 170: Measuring instruments for safe evaluation of ACOPOSmulti SafeMOTION SinCos inverter modules

Information:

The "B&R motors / Encoder list" is current as of the publication of this version of the user's manual. The latest version of the "B&R motors / Encoder list" can be downloaded from www.br-automation.com.

1.3 The idle current principle

Integrated safety technology in the SafeMOTION module uses the idle current principle. When there is a logical 0 at a controller input or the current is interrupted, the corresponding safety function or error response is executed. The idle current principle ensures that the system tends toward the safest possible result in case of failure.

This method is an example of the general principle referred to in engineering as "fail-safe".

This is why the only safe function is the cutoff of a drive's energy and torque. The consequences that are described below are a result of the fail-safe principle.

Danger!

After the safe state (STO) is activated or in state FAIL SAFE, the drive is not supplied with power; the motor therefore no longer exerts torque or force.

If the motor was moving before STO is activated, it is only stopped by a safe motor holding brake (if available) or by the friction of the complete system!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

During a fault event, the drive is not supplied with power; the motor therefore no longer exerts torque or force. Safe pulse disabling (STO) is active.

Information:

Safe pulse disabling

Torque and power are switched off on the drive. No electrical pulses are transmitted from the drive to the motor.

If the drive is in motion at the time of the error, then it will coast to a stop. The residual movement and remaining time must be considered for the worst-case scenario when making all of the calculations for the machine's safety circuit.

Danger!

An error can result in a forward movement followed by the motor coasting to a stop. When estimating the distance and time that results from the forward movement / coasting to a stop, the worst case scenario (i.e. the current maximum possible speed) must always be assumed.

The maximum possible drive speed is calculated from the maximum possible acceleration and the error response time, plus the actively monitored speed limit.

Danger!

Note that multiple errors in the IGBT bridge can cause a brief forward movement. The maximum angle of rotation φ of the motor shaft during this forward movement depends on the motor being used. For permanent magnet synchronous motors, $\varphi = 360^{\circ}/2p$ (for B&R standard motors, p=3 so the angle is 60°). For three-phase induction motors, there is a relatively small angle of rotation between 5° and 15°.

This short forward movement can be excluded as a fault per EN ISO 13849-1, among other things due to the improbability that this would occur and due to general technical experience.

2 Principle - Implementing safety functions

Danger!

The C standards relevant to applications must be observed!

Danger!

Activating safe pulse disabling is not sufficient for achieving a voltage-free drive and therefore does not provide sufficient protection against electrical shock!

2.1 Safe pulse disabling

2.1.1 ACOPOSmulti SafeMOTION inverter module

Safe pulse disabling in ACOPOSmulti SafeMOTION inverter modules has the exact same structure as in standard ACOPOSmulti inverter modules.

The difference is that no external wiring is required. Instead, pulse disabling is activated internally by the SafeMOTION module. The function is controlled via two channels and tested by the SafeMOTION module.

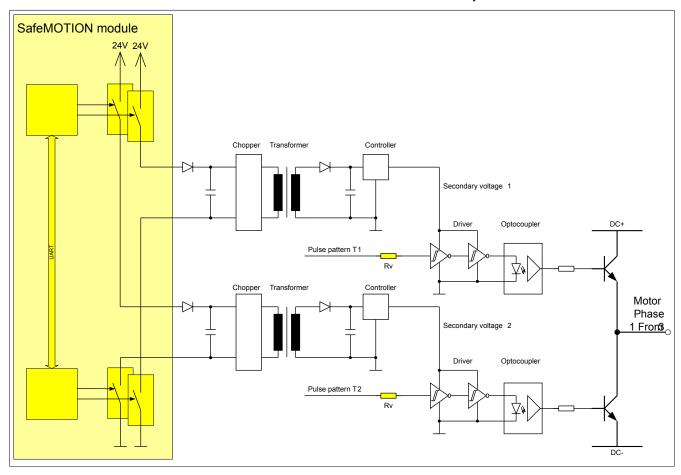

Figure 61: Control of safe pulse disabling - ACOPOSmulti SafeMOTION inverter module

2.1.2 ACOPOSmotor SafeMOTION module

Like standard ACOPOSmotor modules, safe pulse disabling on ACOPOSmotor SafeMOTION modules isolates the power supply for the gate control.

No external wiring is required; instead, pulse disabling is activated internally by the SafeMOTION module. The function is controlled via two channels and tested by the SafeMOTION module.

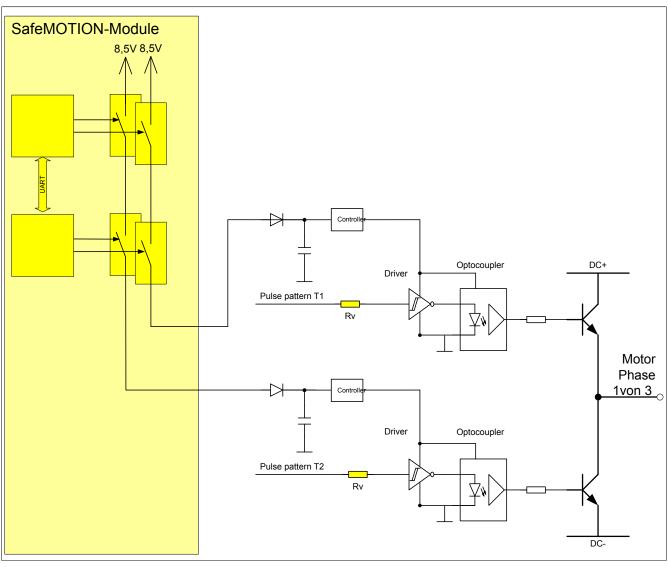

Figure 62: Control of safe pulse disabling - ACOPOSmotor SafeMOTION module

2.1.3 ACOPOS P3 SafeMOTION servo drives

Safe pulse disabling in ACOPOS P3 SafeMOTION servo drives has the exact same structure as in standard ACOPOS P3 servo drives.

The difference is that no external wiring is required. Instead, pulse disabling is activated internally in the module by the SafeMOTION components. The function is controlled via two channels and tested by the SafeMOTION components.

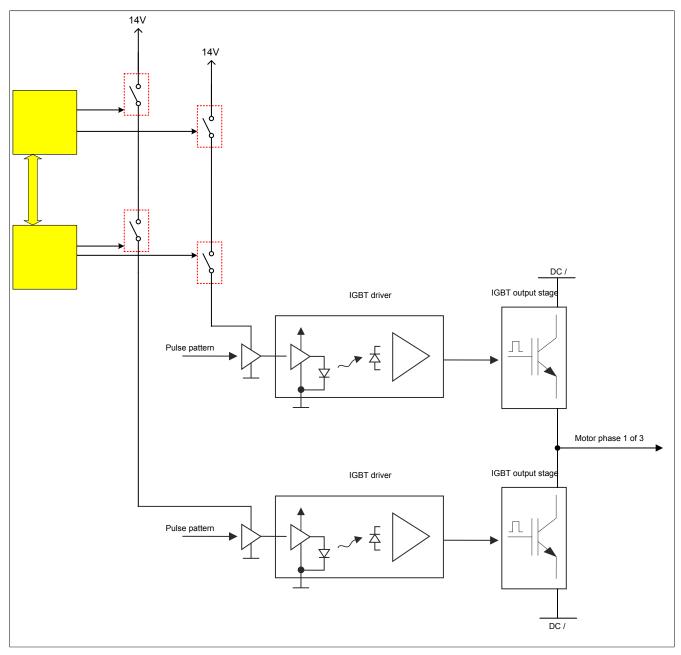

Figure 63: Controlling safe pulse disabling on ACOPOS P3 SafeMOTION servo drives

Information:

Safe pulse disabling is controlled directly by the SafeMOTION module. External wiring is not possible. This also means it is not necessary to apply fault exclusion to wiring errors!

2.2 Safe motor holding brake output

2.2.1 ACOPOSmulti SafeMOTION inverter module

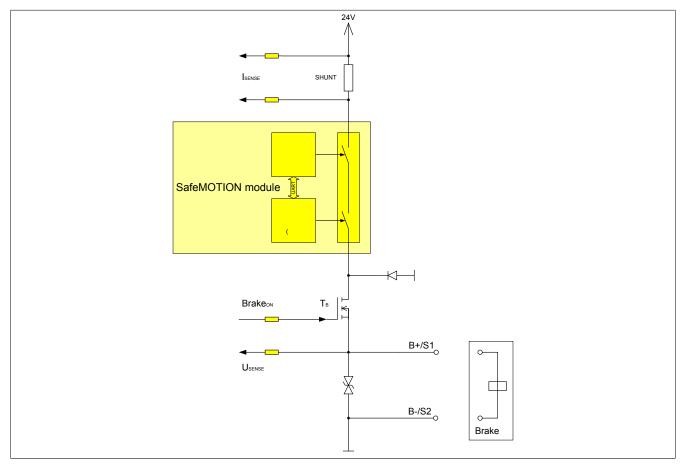

Figure 64: Connection of safe motor holding brake output

A wiring error that causes the output B+ to be shorted to 24 V causes the actuator to remain turned on despite the acknowledgeable FUNCTIONAL FAIL SAFE state being activated.

Error description	Effect	Safety function in accordance with
		Category 3 / SIL 2 / PL d maintained?

	However, this is not critical since the motor holding	The motor holding brake output remains in the safe
	brake is not released in this case (remains engaged).	state.
Short circuit between 24 V and B+	Error detected by module-internal testing.	NO
	The error detection causes the SafeMOTION mod-	Wiring error must be prevented through appropriate
	ule to change to the acknowledgeable error state.	wiring!
	Safe pulse disabling is activated, and the brake al-	
	ways remains open due to the short circuit to 24 V!	
	This is a critical error and must therefore be pre-	
	vented through wiring.	
Short circuit between ground and B+	Error not detected by module-internal testing.	YES,
	However, this is not critical since the motor holding	The motor holding brake output remains in the safe
	brake is not released in this case (remains engaged).	state.

Table 171: Wiring error in safe motor holding brake output

Danger!

A short circuit of SBC output B+ against 24 V results in state FUNCTIONAL FAIL SAFE being enabled. This means that safe pulse disabling is enabled. The brake always remains switched on / released, however, due to the short circuit to 24 V!

This can lead to dangerous situations since the motor holding brake cannot brake, prevent the spinout movement or prevent the unbraked lowering movement when loads are suspended!

A short circuit of SBC output B+ against 24 V must be prevented by suitable wiring measures!

SafeMOTION User's Manual V 4.6.1

Danger!

The SBC output

- is not permitted to be wired across modules!
- is not permitted to be wired as an open emitter!
- is not permitted to be wired as an open collector!

Danger!

Only an output voltage of \leq 5 V can be ensured for the safe motor holding brake output when switched off. When selecting the motor holding brake, the user must ensure that the required braking torque is achieved with a voltage of 5 V applied.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of 600 μ s.

Make sure to take this into consideration when selecting the motor holding brake.

2.2.2 ACOPOSmotor SafeMOTION module

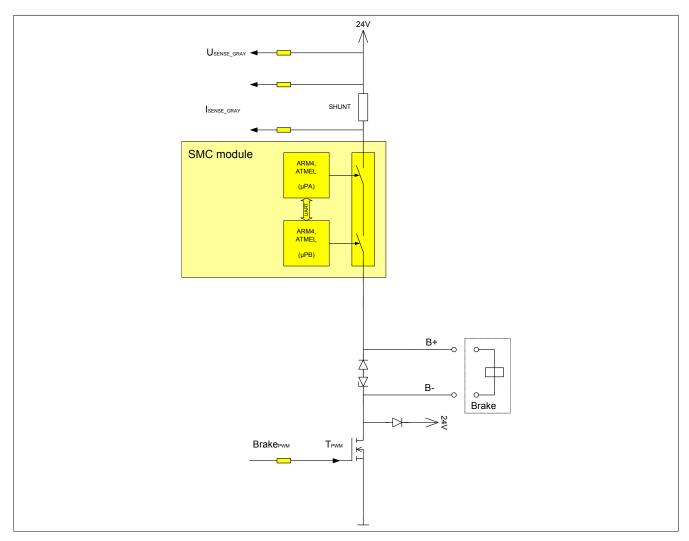

Figure 65: Connection of safe motor holding brake output

Information:

Wiring faults can be excluded since the motor holding brake is integrated in ACOPOSmotor SafeMOTION modules.

2.2.3 ACOPOS P3 SafeMOTION servo drives

The safe motor holding brake output on ACOPOS P3 SafeMOTION servo drives is activated internally in the module by the SafeMOTION components. The function is controlled via two channels and tested by the SafeMOTION components.

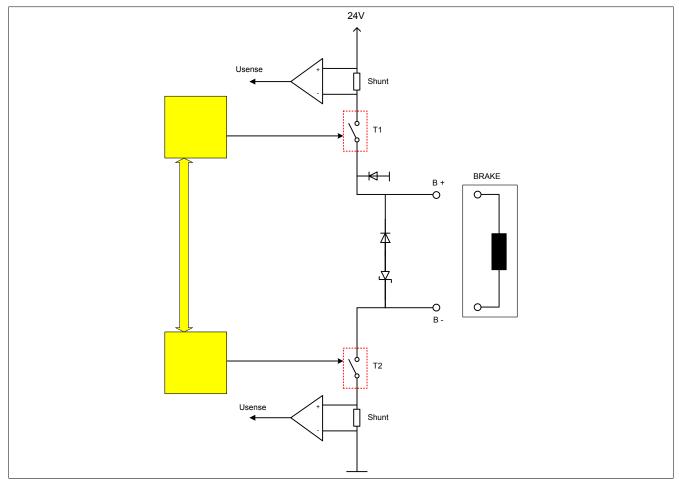

Figure 66: Connection of safe motor holding brake output

The following wiring errors can occur on the safe motor holding brake output:

Error description	Effect	Safety function in accordance with Category 3 / SIL 2 / PL d maintained?
Short circuit: B+ and B-	Error detected by module-internal testing if short circuit current greater than the specified continuous current of the motor holding brake output. The error detection causes the SafeMOTION module to change to the acknowledgeable error state. Safe pulse disabling is activated, and the brake always remains open due to the short circuit to 24 V!	
Short circuit between 24 V and B+	Error detected by module-internal testing. The error detection causes the SafeMOTION module to change to the acknowledgeable error state. Safe pulse disabling is enabled, and the brake output is cut off.	YES, The motor holding brake output remains in the safe state.
Short circuit between ground and B+	Error detected by module-internal testing. The error detection causes the SafeMOTION module to change to the acknowledgeable error state. Safe pulse disabling is activated, and the brake always remains open due to the short circuit to 24 V!	YES, The motor holding brake output remains in the safe state.

Table 172: Wiring error in safe motor holding brake output

SafeMOTION User's Manual V 4.6.1

Danger!

The SBC output

- is not permitted to be wired across modules!
- is not permitted to be wired as an open emitter!
- is not permitted to be wired as an open collector!

Danger!

Only the output current can be ensured for the safe motor holding brake output when switched off. When selecting a motor holding brake, the user must ensure that the required braking torque is reached with current applied.

For the corresponding output current, see the technical data of the respective ACOPOS P3 SafeMOTION servo drive 8EI.

Information:

The transistors of the SBC output stage are tested cyclically. When the output channels are active, this test emits low pulses on the output with a maximum length of $600 \mu s$.

Make sure to take this into consideration when selecting the motor holding brake.

Danger!

The motor holding brake is engaged in the safe state. The motor holding brake will suffer mechanical wear if the motor is in motion just before the safe state is triggered. This must be taken into account when selecting and dimensioning the motor holding brake (emergency stop capability).

Information:

The safe motor holding brake output is only a part of safe function group "Safe motor holding brake". The motor holding brake must be included when determining the safety category or SIL for the entire function group.

2.3 Safe encoder input

2.3.1 Assessing the safety integrity of the overall system

The entire chain, from the encoder to the safety function, must always be taken into consideration when assessing safety integrity.

2.3.1.1 PFH value

To determine the PFH value for the entire safety chain, the PFH value of the current safety function (see 3 "Safety characteristics of integrated safety functions" on page 313) and the PFH value of the encoder must be added:

2.3.1.2 Category

To determine the category, the category of the respective safety function and the category of the encoder must both be taken into account (encoder manufacturer specifications or determined according to method described).

They must be viewed as a chain, which means the lower of the two categories must be used!

2.3.1.3 Performance level

When determining the performance level of the overall system, all elements that participate in the safety function must be viewed as a chain.

The PL that is achieved for the safety function can then be determined according to "figure 5" or "table K.1 – Numerical representation of figure 5" in EN ISO 13849.

2.3.1.4 SIL

The SIL of the overall system results from the overall PFH value. As a rule of thumb, the drive system (safety function of the ACOPOSmulti SafeMOTION inverter module plus the measuring instrument used) should account for no more then 10% of the SIL limit.

Note that the maximum SIL of the respective safety function (see 3 "Safety characteristics of integrated safety functions" on page 313) cannot be exceeded. This also applies if the PFH value of the chain would be sufficient to achieve a higher SIL!

A maximum of SIL 2 can be reached with a non-certified SinCos encoder.

Safety-related evaluation is not possible for EnDat 2.2 encoders without FS certification, and they therefore cannot be used for safety functions that require safe position evaluation.

2.3.2 Electrical interface

2.3.2.1 EnDat 2.2 functional safety encoder

The concept of integrated safety functions in SafeMOTION EnDat 2.2 modules³⁾ includes the use of an EnDat 2.2 functional safety encoder from Heidenhain.

The EnDat 2.2 safety encoder must be installed in such a manner as to eliminate the possibility of slippage and encoder shaft breakage. Please follow the installation guidelines from Heidenhain.

In some applications, the SafeMOTION module is able to sufficiently detect encoder slippage or encoder shaft breakage. Mechanical fault exclusion is not necessary for these applications.

Danger!

Some safety-related measuring instruments are only permitted to be used in the closed control loop. This limitation is indicated in the technical data for the respective measuring instrument.

These types of safety-related measuring instruments are not permitted to be used in combination with a SafeMOTION EnDat 2.2 module!

Information:

If safety functions are used that require a safe speed and/or position, then a Heidenhain EnDat 2.2 functional safety encoder must be used. Otherwise, the process data from the encoder is set to the FUNCTIONAL FAIL SAFE state.

2.3.2.1.1 Safe encoder counting range

For the safe encoder counting range, see the data sheet for the respective encoder. On ECN 1325 single-turn and EQN 1337 multi-turn rotary encoders, this range corresponds with the single-turn range. See excerpt from the data sheet:

Technische Kennwerte	Absolut		
	ECN 1325 EQN 1337 Multitum		
Funktionale Sicherheit für Anwendungen bis	 SIL 2 nach EN 61508 (weitere Prüfgrundlage: EN 61800-5-2) Kategorie 3 PL d nach EN ISO 13849-1:2008 		
	Sicher im Singleturn-Betrieb		

Information:

The manufacturer's most recent data sheet is the one that is valid. The user is responsible for obtaining this information from the manufacturer.

2.3.2.2 Sine-Cosine encoders

The conceptual design of the ACOPOSmulti SafeMOTION SinCos inverter module includes safe evaluation of analog, sinusoidal incremental signals. For this to be possible, the encoder must meet the requirements specified under 2.3.2.2.1 "Safety requirements for SinCos measuring instruments" on page 296.

2.3.2.2.1 Safety requirements for SinCos measuring instruments

General information

In table D.16, the DIN EN 61800-5-2 standard specifies a general fault model for motion and position sensors that is independent of the construction and design of the motion and position sensors. The following specifications regarding the fault model specified in DIN EN 61800-5-2 refer only to the purely analog 1 V_{ss} signals of a measuring instrument.

Technical data for the encoder interface

The measuring instrument must be suitable according to the technical data for the encoder interface.

Encoder interfaces 1)	
Encoder power supply	
Output voltage	5 V ±5% ²⁾
Load capacity	300 mA ³⁾
Sense lines	2, compensation of max. 2 x 0.7 V
Protective measures	
Short-circuit proof	Yes
Sine/Cosine inputs	
Signal transmission	Differential signals, symmetrical
Differential voltage	
In motion	0.5 to 1.35 V ⁴⁾
At standstill	0.8 to 1.35 V ⁵⁾
Differential voltage deviation per signal period	±10% ⁶⁾
Common-mode voltage	Max. ±7 V
Terminating resistor	120 Ω
Max. input frequency	200 kHz
Signal frequency (-5 dB)	<300 kHz
Signal frequency (-3 dB)	DC up to 200 kHz
ADC resolution	12-bit

Table 173: Encoder interface - Technical data

- 1) Only shielded cables are permitted to be used.
 - The stranded wire for the analog interface (Sin, nSin, Cos, nCos, Ref, nRef) and the digital interface (T, nT, D, nD) must be twisted pair with a wave impedance of 120 Ω ±10%.
 - Additional shielding of the analog interface is recommended.
- During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected.
 - A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.
 - An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.
- 3) An actual reserve of 12 mA exists for the terminating resistor.
- 4) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.
 - The pointer length $z = 2 \sqrt{((Sin nSin)^2 + (Cos nCos)^2)}$ is monitored according to the specified limits.
- 5) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring.

 The pointer length z = 2 √((Sin nSin)² + (Cos nCos)²) is also monitored according to the specified limits from the time the evaluation circuit is switched on until a signal period has passed.
- 6) The sine-cosine output signals from the measuring instrument are checked by the evaluation circuit using pointer length monitoring. The pointer length z = 2 √((Sin - nSin)² + (Cos - nCos)²) is permitted to deviate by a maximum of ±10% per signal period.

Danger!

During the power-on procedure for the encoder power supply voltage (2 seconds), the monitoring limit for the supply voltage is increased from 5.25 V to 6 V. In this phase, overvoltages up to 6 V are not detected

A short-term overvoltage of maximum 6 V is not permitted to damage the encoder electronics in any way.

An undervoltage on the encoder power supply will result in a sine or cosine signal outside the specification.

Requirements from the "Error list for movement and position sensors per EN 61800-5-2:2007", table D.16

The following requirements from the error list must be assessed and implemented by the manufacturer of the measuring instrument or the machine manufacturer.

No.	Fault description	Fault exclusion	Comment	Requirements that must be met by the measuring instrument manufacturer or machine manu- facturer
8	Parts become loose at a standstill: Sensor housing comes off motor housing Sensor shaft comes off motor shaft	FMEA and proof of fatigue strength of mechanical attachment	Output signal indicates a speed of zero. If fault exclusion is employed, the fastening mechanism for the sensor housing on the motor housing and the sensor shaft on the motor shaft generally withstands excessive stress up to a factor of approximately 20x and any special maintenance information must be provided.	Fault exclusion based on appropriate mounting must be applied in all cases. Exceptions: In synchronous motors applications where the encoder is integrated in position control, errors can be localized using the safe lag error monitoring function in the SafeMOTION module.
9	Fastening mechanism comes loose during movement: Sensor housing comes off motor housing Sensor shaft comes off motor shaft	FMEA and proof of fatigue strength of mechanical at- tachment	Potential effect: • Static offset of sensor shaft • Dynamic slippage of sensor shaft • Output signal is incorrect / indicates a speed of zero If fault exclusion is employed, the fastening mechanism for the sensor housing on the motor housing and the sensor shaft on the motor shaft generally withstands excessive stress up to a factor of approximately 20x and any special maintenance information must be provided.	Fault exclusion based on appropriate mounting must be applied in all cases. Exceptions: In synchronous motors applications where the encoder is integrated in position control, errors can be localized using the safe lag error monitoring function in the SafeMOTION module.
10	Measuring element comes loose ^{a)} (e.g. optical encoder disc)	None	Output provides incorrect position information	An error that would lead to a position deviation larger than ±1/2 of a signal period must change the sine-cosine signal enough that pointer length monitoring detects an error. This error must be assessed by the measuring instrument manufacturer.
11	No light in front of sensor diode	None	-	An error that would lead to a position deviation larger than ±1/2 of a signal period must change the sine-cosine signal enough that pointer length monitoring detects an error. This error must be assessed by the measuring instrument manufacturer.
Additio	onal requirements for rotary	encoders with sin/cos output	signals, analog signal generation	
12	Static signal on inputs and outputs, individual or on multiple signals, amplitude in the voltage supply range		-	The output signals (sine and cosine) must be generated independently. If this requirement is met, the error is detected by pointer length monitoring on the SafeMOTION module with a diagnostic coverage (DC) of 99%.
14	sine output signal	Fault exclusion is permit- ted if no electronic compo- nents are used to select an output signal from multiple sources.		Fault exclusion is required by the measuring instrument manufacturer.
Additio	onal requirements for encode	ers of with synthetically gener	ated output signals	

Table 174: Error list for movement and position sensors using the standardized error model per EN 61800-5-2:2007 (Table D.16)

No.	Fault description	Fault exclusion	Comment	Requirements that must be met by the measuring instrument manufacturer or machine manu- facturer
21	Distortion of the output signals in any way	None	-	Synthetically generated output signals are not permitted to be used.
				Exception: Encoders with safety certification, as long as error detection in the encoder is safety-related.
Additio	onal requirements for linear	encoders		
23	Mounting for read head broken		If fault exclusion is required, the sensor mounting usually withstands the excessive stress that takes place and specific maintenance information should be spec-	ate mounting must be applied in all
			ified.	Exceptions: In synchronous motors applications where the encoder is integrated in position control, errors can be localized using the safe lag error monitoring function in the SafeMOTION module.
24	Static offset of measuring element ^{a)} (e.g. optical encoder strips)	None	-	An error that would lead to a position deviation larger than ±1/2 of a signal period must change the sine-cosine signal enough that pointer length monitoring detects an error. This error must be assessed by
				the measuring instrument manufacturer.
25	Damaged measuring element ^a) (e.g. optical encoder strips)	l .	Pulse shape changed. Pulses missing on incremental encoders	An error that would lead to a position deviation larger than ±1/2 of a signal period must change the sine-cosine signal enough that pointer length monitoring detects an error.
				This error must be assessed by the measuring instrument manufacturer.

NOTE: This table was written assuming the use of optical sensors. If other sensors are used (e.g. inductive sensors), then the respective errors apply.

Table 174: Error list for movement and position sensors using the standardized error model per EN 61800-5-2:2007 (Table D.16)

- Does not apply to resolvers.
- b) Applies correspondingly to linear encoders.

Items not listed in table D.16 are covered by the safety-related evaluation of the sine and cosine signals on the ACOPOSmulti SafeMOTION SinCos inverter module with a diagnostic coverage of 99%!

EMC requirements for the SinCos measuring instrument

The necessary EMC tests must conform with the higher testing levels per IEC 61326-3-1. The measuring instrument manufacturer or machine manufacturer must provide proof that the measuring instrument conforms to the higher testing levels!

Safety-related values

The ACOPOSmulti SafeMOTION SinCos inverter module offers the possibility of using certified or non-certified SinCos measuring instruments. When determining the safety characteristics of the overall system, non-certified and certified encoders require different procedures.

Non-certified measuring instruments

In order to assess safety integrity, the measuring instrument manufacturer must provide one of the following characteristics. These values can then be used to calculate the PFH for the encoder via diagnostics and encoder evaluation and therefore assess the safety integrity of the overall system.

Value	Unit	Short name	Description
MTTF	[h]	Mean time to failure (mean time to failure)	The MTTF can be directly used to assess safety concepts per EN ISO 13849. The MTTF (mean time to failure) can be performed for components by analyzing field data or by predictive analysis. At a constant failure rate, the average of the failure-free operating time MTTF = $1/\lambda$, where λ is the failure rate of the instrument. (Statistically, the assumption can be made that 63.2% of the respective components will experience failure after the MTTF has expired.)
λ	[10 ⁻⁹ 1/h],[FIT]	Failure rate (Failures In Time)	To assess the safe failure rate according to DIN EN 61508, the FIT value (reciprocal of the MTTF value) must be used as the failure rate.
λ_{D}		Dangerous failure rate	If no detailed breakdown of failure rates $(\lambda_F = \lambda_{F1} + \lambda_{F2} + + \lambda_{Fn})$ is specified for the measuring instrument being used, the default rate is equally distributed among the faults tak-
λ _s		Safe failure rate	en into account in the error model in table D.16 in DIN EN 61800-5-2. If no detailed breakdown of failure rates ($\lambda_F = \lambda_S + \lambda_D$) is specified for the measuring instrument being used, then 50% of the failures will be assumed dangerous per EN ISO 13849.

Table 175: Characteristics required for non-certified SinCos measuring instruments

Calculating the relevant characteristic values when using non-certified SinCos measuring instruments

PFH value of the encoder with diagnosis of encoder evaluation

The safety integrity level is determined based on the PFH value. There are two methods for determining the PFH value of the encoder with diagnosis of encoder evaluation:

⇒ Method 1: Determining from the MTTF_d (mean time to dangerous failure) of the encoder being used The probability of failure per hour (PFH) for the safety function is calculated from the MTTF_d of the encoder being used and the DC of the SafeMOTION module.

$$PFH_{Encoder} = \frac{1 - DC}{MTTF_d}$$

In the absence of more detailed information about the failure of the measuring instrument, it is assumed that 50% of errors are dangerous.

$$MTTF_d = 2MTTF$$

 \Rightarrow Method 2: Determining from the λ_D (dangerous failure rate) of the encoder being used

The probability of failure per hour (PFH) for the safety function is determined from the dangerous failure rate (λ_D) of the encoder and the DC of the SafeMOTION module.

$$PFH_{Encoder} = \lambda_D(1-DC)$$

The encoder evaluation of the ACOPOSmulti SafeMOTION SinCos inverter module has a DC of 99%.

Category (Cat.) of the encoder with diagnosis of encoder evaluation

Safe encoder evaluation can be assessed at Cat. 3 when using a non-certified measuring instrument. This is because the requirements from EN ISO 13849 for diagnostic coverage (DC) and common cause factor (CCF) are met through the named requirements and through the monitoring of the encoder power supply voltage in the evaluation logic.

Performance level (PL) of the encoder with diagnosis of encoder evaluation

The performance level of a system can be determined using the figures or tables provided in EN ISO 13849.

Depending on the $MTTF_d$ and PFH value of the SinCos encoder, up to PL d can be achieved (see figure 5 in EN ISO 13849).

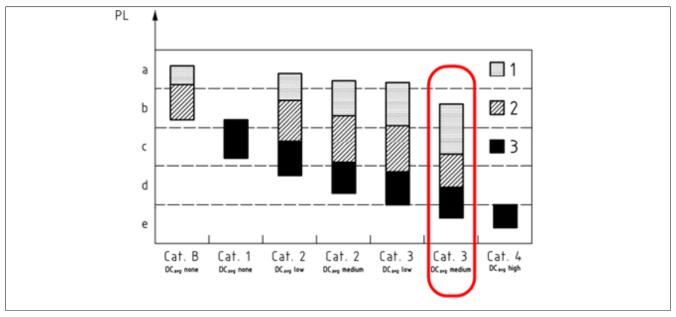

Figure 67: Relationship between DCavg, MTTFd of each channel and PL according to EN ISO 13849-1, figure 5

N10008Legend:

- 1 MTTF_d of each channel = Low
- 2 MTTF_d of each channel = Medium
- 3 MTTF_d of each channel = High
- PL Performance level

MTTF _d		
Name for each channel Range for each channel		
Low	3 years ≤ MTTF _d < 10 years	
Average	10 years ≤ MTTF _d < 30 years	
High	30 years ≤ MTTF _d ≤ 100 years	

Table 176: Mean time to dangerous failure (MTTFd) of each channel per EN ISO 13849-1, table 5

SIL capability of the encoder with diagnosis of encoder evaluation

The safety integrity level of a device depends on whether it is operated in a high demand mode of operation or low demand mode of operation.

When operating in a high demand mode of operation, it is assumed that the safety function will be requested continuously or an average of once per hour. For a continuous or high demand mode of operation, the PFH measure is used, which specifies the safety function's probability of failure per hour.

A position measuring instrument is evaluated as a device with a high demand mode of operation.

The maximum possible safety integrity level of a SinCos encoder can be determined as follows.

Safety integrity level (SIL)	Average frequency of dangerous failure of the safety function [h ⁻¹] (PFH)
4	≤10 ⁻⁹ to <10 ⁻⁸
3	≤10-8 to <10-7
2	≤10 ⁻⁷ to <10 ⁻⁶
1	≤10 ⁻⁶ to <10 ⁻⁵

Table 177: Safety integrity levels and target failure measures for a safety function operating in high demand mode of operation or continuous mode of operation per EN 61508-1:2010, table 3

The following characteristic values are used to assess the SIL:

System type

As defined in DIN EN 61508, systems are classified as Type A and Type B. Since a SinCos encoder includes complex components (e.g. OPV), it is considered a Type B system.

Hardware fault tolerance (HFT)

A hardware fault tolerance of N means that N+1 faults could lead to a failure of the safety function. The hardware fault tolerance is determined based on the MooN architecture used. MooN stands for "M out of N channel architecture" and describes the architecture of a SIL device. For example, "1002" refers to an architecture with 2 channels where either of the channels is able to execute the safety function.

In order to provide single fault tolerance, both signals (sine and cosine) must be generated independently and the safety function (position information) must be contained in both signals. The position information can only be obtained by evaluating both signals, however.

The SinCos encoder input is to be viewed as single-channel with respect to the position and speed safety functions and can only be assessed as HFT = 0.

Safe Failure Fraction (SFF)

SFF is the fraction of safe failures. The higher the required SIL rating, the higher the SFF must be. A system's SFF is calculated from the failure rates (λ values) of the individual components.

To determine the SFF of the SinCos encoder, pointer length monitoring of SinCos signals in the SafeMOTION module is used to increase diagnostic coverage. This additional diagnostics increases the DC level to HIGH.

Safe failure fraction of an element	Hardware fault tolerance		
	0	1	2
<60%	Not permitted	SIL 1	SIL 2
60% - <90%	SIL 1	SIL 2	SIL 3
90% - <99%	SIL 2	SIL 3	SIL 4
≥99%	SIL 3	SIL 4	SIL 4

Table 178: Maximum allowable safety integrity level for a safety function carried out by a type B safety-related element or subsystem per EN 61508-2:2010, table 3

Information:

When a safety-related system executes a safety function over a single channel, the maximum safety integrity level that can be claimed for the safety function under consideration shall be determined by the subsystem with the lowest requirements for hardware safety integrity.

Information:

The overall ACOPOSmulti SafeMOTION SinCos inverter module system is certified for a maximum safety integrity level of SIL 2 for evaluation of non-certified encoders.

Certified measuring instruments

For certified measuring instruments, the manufacturer must specify the necessary safety characteristics.

Verify that all specified diagnostic properties are fulfilled.

Value	Unit	Short name	Description	
SIL SIL CL	[]	Safety integrity level (Safety Integrity Level) SIL Claim Level	The safety integrity level is one of four discrete levels used to specify the requirement for the safety integrity of the safety functions assigned to the safety-related system, with 4 being the highest level for safety integrity and 1 the lowest. The failure limits for the four safety integrity levels are defined in tables 2 and 3 of IEC 61508-1.	
PFH	[10 ⁻⁹ 1/h], [FIT]	Probability of safety function failure per hour (Probability of failure per pour)	When operating in a high demand mode of operation, it is assumed that the safety function will be requested continuously or an average of once per hour. For a continuous or high demand mode of operation, the PFH measure is used, which specifies the safety function's probability of failure per hour.	
PL	[]	Performance level	The ability to operate safety-related parts of control systems or to perform a safety fun tion under foreseeable conditions is assigned a performance level (PL) from a scale five levels. These performance levels are defined according to the probability of a da gerous failure per hour (see EN ISO 13849-1:2006, table 3).	
Cat.	[]	Category	Assesses how well safety-related components in a control system behave when an erroccurs.	
DC	[%]	Diagnostic coverage (diagnostic coverage)	Partial reduction of the probability of dangerous hardware failures resulting from the use of automatic diagnostic tests Safe evaluation is based solely on the analog Sin/Cos signals. If the measuring instrument contains an internal diagnostics function, then the discovered errors must be reported through a violation of the SinCos interface specification on the subsequent electronics. Only then does it make sense to take into account the level of diagnostic coverage. If a DC is specified, then a provision must also be specified for the diagnostic test interval. Period between online tests to detect faults in a safety-related system with specified diagnostic coverage.	
T _m	[years], [a]	Mission time (mission time)	The mission time must be determined by the device manufacturer and specifies the maximum amount of time an encoder can be used. The encoder must be replaced before the mission time expires!	
Tı	[years], [a]	Proof test interval (proof test interval)	Recurring test for fault detection in a safety-related system, which can restore the system to a "like new" condition or as close to it as possible from a practical standpoint. A proof test is normally not possible for electronic devices. The mission time and proof test interval are therefore generally the same.	

Table 179: Characteristic values required for certified SinCos measuring instruments

Category (Cat.) of the encoder with diagnosis of encoder evaluation

Danger!

Valid freezing only detected in movement with DC = 99%!

To exclude accumulation of faults at a standstill, movement must take place once a day by at least one signal period of the encoder.

The necessary movement can take place in the course of a functional positioning or homing procedure.

Safe encoder evaluation can be assessed at Cat. 4 when a suitable (certified) measuring instrument is used and the above limitations are taken into account.

Estimation of the achievable safety levels based on the example of a Heidenhain ECN 1313 / EQN 1325

Manufacturer specifications

According to an analysis of the document D662649-01-E-01 from Heidenhain, ECN 1313 and EQN 1325 encoders are deemed suitable for use with the ACOPOSmulti SafeMOTION SinCos inverter module.

The following MTTF / FIT values are specified:

Туре	ID number	MTTF [h]	FIT [10 ⁻⁹ /h]
ECN 1313	586640-11	>1,666,667	<600
ECN 1313	586643-03	>1,666,667	<600
EQN 1325	586653-06	>1,666,667	<600
EQN 1325	586654-05	>1,666,667	<600

Table 180: MTTF values for Heidenhain ENC 1313 and EQN 1325 encoders according to Heidenhain document D662649-01-E-01

Calculating characteristic values of the encoder with diagnosis of encoder evaluation

Since ECN 1313 and EQN 1225 encoders have the same MTTF values, the following calculations apply to both encoder types.

Safety technology • Principle - Implementing safety functions

Characteristic value	ECN 1313 / EQN 1325
MTTF	1,666,667 [h]
MTTF _d	3,333,334 [h] = 380 years = High
PFH _{encoder}	3*10 ⁻⁹ [h ⁻¹]
CAT / PL	Cat 3 / PL d
SIL	Max. SIL 2 since the encoder is not certified

Table 181: Calculated characteristic values for Heidenhain ECN 1313 and EQN 1325 with diagnosis of encoder evaluation of the ACOPOSmulti SafeMOTION SinCos inverter module

Calculating the characteristic values of the overall system

The following tables show an example of the safety characteristics for the safety functions of the ACOPOSmulti SafeMOTION SinCos inverter module, performance class XXX, in combination with a Heidenhain ECN 1313 or EQN 1325 encoder:

Safety function	PFH	CAT / PL / SIL
STO	1*10 ⁻⁰⁹ [h ⁻¹]	Cat. 4 / PL e / SIL 3
STO1	1*10 ⁻⁰⁸ [h ⁻¹]	Cat. 3 / PL d / SIL 2
SBC	1*10 ⁻⁰⁸ [h ⁻¹]	Cat. 3 / PL d / SIL 2
sos	6*10 ⁻⁰⁹ [h ⁻¹] + 3*10 ⁻⁰⁹ [h ⁻¹] = 6*10 ⁻⁰⁹ [h ⁻¹]	Cat. 3 / PL d / SIL 2
SS1		
SS2		
SLS		
SMS		
SDI		
SLI		
Safe Speed		
Safe Homing	6*10 ⁻⁰⁹ [h ⁻¹] + 3*10 ⁻⁰⁹ [h ⁻¹] = 6*10 ⁻⁰⁹ [h ⁻¹]	Cat. 3 / PL d / SIL 2
SLP	Only with safe encoder mounting (see table	Only with safe encoder mounting (see table D.16, No. 8 and 9,
SMP	D.16, No. 8 and 9, fault exclusion)	fault exclusion)
Safe Position		
SBT	2*10 ⁻⁰⁸ [h ⁻¹] + 3*10 ⁻⁰⁹ [h ⁻¹] = 2.3*10 ⁻⁰⁸ [h ⁻¹]	Cat. 3 / PL d / SIL 2

Table 182: Safety characteristics for 8BVIXXXXSA.XXX-X ACOPOSmulti SafeMOTION Sin-Cos inverter modules in combination with a Heidenhain ECN 1313 or EQN 1325 encoder

2.3.3 Mechanical mounting

2.3.3.1 Status of the proof of fatigue strength of the encoder mounting

Information:

This functionality is only available in hardware upgrade 1.10.3.x or later!

For B&R motors, the status of the fatigue strength of the encoder mounting is saved in the motor data record.

By setting parameter "General settings - Encoder monitoring - Safe Encoder Mounting" to value "From motor data record", the status of the fatigue strength of the encoder mounting is read out and used to verify the available safety functions.

For motors that have not stored any mounting information in the motor data record, but for which the fatigue strength of the encoder mounting can still be verified, parameter "General settings - Encoder monitoring - Safe Encoder Mounting" must be set to value "Approved by user" so that all safety functions can be used.

For motors for which no proof of fatigue strength of the encoder mounting is provided, parameter "General settings - Encoder monitoring - Safe Encoder Mounting" must be set to value "From motor data record". In this case, proceed as described in 2.3.3.3 "Encoder mounting without proof of fatigue strength - Safe lag error monitoring" on page 306.

Information:

The status of the proof of fatigue strength of the encoder mounting stored in the motor data record is not reliable from the point of view of safety. Verification of the available safety function is a standard (non-safe) monitoring operation.

Parameter	Unit	Description		Default value	Starting in Safety Release
Encoder monitoring - Safe En-		Status of the proof	f of fatigue strength of the encoder mounting	From motor data	R1.10

(previously Encoder monitor- ing Speed tolerance (units/s))					

Table 183: SafeMOTION parameter group: General settings - Encoder monitoring

2.3.3.2 Encoder mounting with proof of fatigue strength⁴⁾

To prevent errors caused by encoder slippage or shaft breakage, the mechanical mounting of the encoder requires proof of fatigue strength.

This proof and the corresponding mounting guidelines can be provided either by the manufacturer of the measuring instrument or by the manufacturer of the machine.

Danger!

To ensure safe operation up to and including the motor shaft, any errors in the connection between the motor shaft and encoder must be identified and prevented.

Danger!

Proof of fatigue strength for the encoder's mechanical mounting is to be dimensioned to the maximum rotor acceleration. This acceleration value is not permitted to be exceeded in the worst case. The maximum acceleration is monitored on the SafeMOTION module and can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Mechanical tolerances in the encoder mounting must be taken into account when calculating the residual distance. This residual movement must be taken into account by the safety functions.

Danger!

To ensure safe operation up to and including the motor shaft, any errors in the connection between the motor shaft and encoder must be identified and prevented.

There are specific guidelines that must be followed when installing a functional safety encoder.

The motor manufacturer must ensure that these specifications are adhered to.

⁴⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

Danger!

The frictional connection between the cone-shaped shaft of the rotor and measuring instrument can be dimensioned for maximum rotor acceleration in accordance with the mounting instructions provided by the encoder manufacturer. This acceleration value is not permitted to be exceeded in the worst case. The maximum acceleration is monitored on the SafeMOTION module and can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

If the terminal screw for the coupling ring becomes loose on installed measuring instruments, then the form-fit pin will be the only thing holding the encoder to the motor housing. A movement in accordance with the mounting tolerances is possible. The encoder is not able to register this movement. This residual movement must be taken into account by the safety functions.

2.3.3.3 Encoder mounting without proof of fatigue strength - Safe lag error monitoring⁵⁾

If "General settings - Encoder monitoring" is activated in the SafeMOTION module, in some applications the proof of fatigue strength for the mechanical mounting of the encoder is not required.

The following safety-related restrictions must be taken into account!

Danger!

Only safety functions in which no safe absolute position is monitored are permitted to be used (STO, SBC, SOS, SS1, SS2, SLS, SMS, SLI, SDI, SLA, SBT (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION), SLT (only available for ACOPOS P3 SafeMOTION) and Safe Speed).

Danger!

The application must meet the following requirements for safety-related monitoring of the encoder-motor connection:

- Encoder connection monitoring is only permitted to be used for encoders that are integrated in position control.
- Encoder connection monitoring is only permitted to be used for drive systems with synchronous motors.
- The encoder must be protected against shearing in standstill (e.g. with encasement in the motor housing)!
- Monitoring for position lag errors, speed errors and position setpoints change (Alive Testing) must be enabled in the safety application, and sufficiently strict limits must be monitored!
- Safety functions Safe Position, SLP and/or SMP are not permitted to be not be used!
- Safe monitoring can only be guaranteed when closed-loop control is enabled.

Danger!

- An electrical offset of <90° will not be detected sufficiently.
- There is no way to monitor the encoder connection if the setpoint remains constant.
- An encoder connection error or an error in encoder evaluation is always assumed as the cause for the lag error.
- The error reaction in the standard application to a position lag error or speed error is disabled by the SafeMOTION module (overridden). When lag errors occur, only the error responses STO or STO1 with an induction stop are possible.

Danger!

Note that an error can result in a forward movement. The maximum angle of rotation ϕ of the motor shaft during this forward movement depends on the motor being used.

For permanent magnet synchronous motors, ϕ = 360°/2p. For three-phase induction motors, there is a relatively small angle of rotation between 5° and 15°.

⁵⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

The maximum speed of the forward movement can be calculated as follows:

$$n_{Jolt} = \frac{1}{2\pi} \sqrt{\frac{6a_{max}}{\rho_z}} \left[\frac{U}{S} \right]$$

With the maximum acceleration $a_{max} = \frac{M_{max}}{J} \left[\frac{rad}{s^2} \right]$ And number of motor pole pairs p_z

Danger!

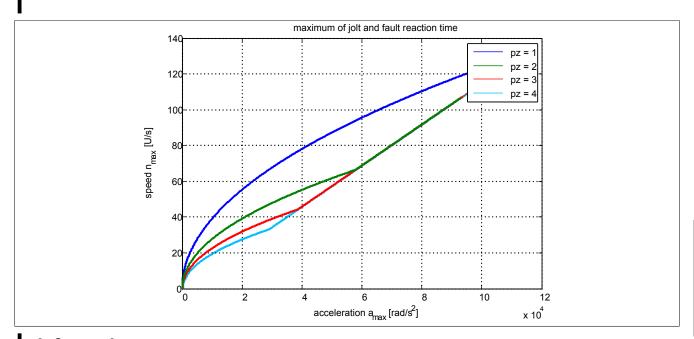

When viewing the worst-case scenario for a safety function, the highest value of the maximum speed of the forward movement n_{Jolt} And the speed due to the maximum error response time $n_{T_{worstcase}}$.

$$n_{max} = max(n_{Jolt}, n_{T_{worstcase}}) = max\left(\frac{1}{2\pi}\sqrt{\frac{6a_{max}}{P_z}}, \frac{T_{worstcase}}{2\pi} \cdot a_{max}\right)$$

With the maximum error response time $T_{worstcase} = 7.2[ms]$

The maximum speed n_{max} resulting from this must be considered together with the speed when the safety function n_{LIM} is violated in order to determine the maximum possible speed $n_{worstcase}$ at the time of coasting to a stop.

 $n_{worstcase} = n_{LIM} + n_{max}$

Information:

In order to check the plausibility of setpoint selection after each power on, the axis must be moved by at least twice the configured lag error limit before the first request of a safety function, which requires a safe encoder evaluation, or at least within 15 min.

If this is not done, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

In the event of an error, a synchronous axis will no longer be synchronous.

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Information:

A 24-hour timeout begins after successfully checking the plausibility of the setpoint.

The timeout is reset any time the position setpoint changes by more than twice the position lag error tolerance.

If the position setpoint does not change during 24 hours of continuous controller operation, then the SafeMOTION module will switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous.

The following parameters are relevant for safe monitoring of the encoder-motor shaft connection (Encoder Monitoring):

Group: General settings - Encoder monitoring (previously Encoder Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Release
Encoder monitoring - Safe En-			of fatigue strength of the encoder mounting	From motor data	R1.10
coder Mounting (Hardware up-	record / Approved	Value	Description	record	
grade 1.10.3.x and later)	by user	From motor data record	The status of the encoder mounting is determined using the motor data record.		
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.		
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the dule	Enabled	R1.3
		Value	Description		
(previously Encoder Position		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Speed error monitoring - Enable	or monitoring - Enable Disabled SafeMOTION module		Enabled	R1.3	
		Value	Description		
(previously Encoder Speed monitoring)		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Position setpoint alive testing (SPA) -	Enabled/ Disabled		Ites the monitor that detects whether the position setpoint SafeMOTION module is frozen.	Disabled	R1.3
Enable		Value	Description		
(proviously Set position alive		Enabled	Monitoring active		
(previously Set position alive testing)		Disabled	Monitoring not active		
Encoder monitoring - Position error tolerance	[units]	Position lag error t	olerance for shaft breakage monitoring	0	R1.3
(previously Encoder monitor- ing Position tolerance (units))					
Encoder monitoring - Speed error tolerance	[units/s]	Speed error tolera	nce for encoder monitoring	0	R1.3
(previously Encoder monitor- ing Speed tolerance (units/s))					

Table 184: SafeMOTION parameter group: General settings - Encoder monitoring

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description	Default value	Starting in Safety Release
EUS - Encoder acceleration limit	[rad/s²] or [mm/s²]	Maximum permissible encoder acceleration	100000	R 1.4
(previously Maximum acceleration (rad/s² or mm/s²))				

Table 185: SafeMOTION parameter group: General settings - Encoder Unit System

Information:

The physical drive speed is not permitted to exceed the value set for parameter "EUS - Maximum speed to normalize speed range"; otherwise, the SafeMOTION module will switch to the error state!

Danger!

If the manufacturer of the measuring instrument specifies a limitation of the maximum acceleration, this must be monitored by the SafeMOTION module. The acceleration to be monitored can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Incorrectly configuring the unit system can result in dangerous situations.

When validating the application, the monitored speed limits must be intentionally violated and their physical values tested! The same must also be done for the monitored direction of rotation!

Danger!

The machine manufacturer is responsible for determining whether or not the application is suited for safe encoder connection monitoring if there is no mechanical mechanism for detecting encoder shaft breakage.

The machine manufacturer is responsible for ensuring that the safe encoder monitoring has been configured correctly!

Danger!

Encoder connection monitoring is only permitted to be used in a safety-related capacity if the aforementioned requirements for the application have been fulfilled!

2.3.3.1 Activating monitoring⁶⁾

The following parameters must be set to "Enabled" in SafeDESIGNER in order to enable safe encoder connection monitoring:

- "Encoder monitoring Position error monitoring Enable" = Enabled
- "Encoder monitoring Speed error monitoring Enable" = Enabled
- "Encoder monitoring Position setpoint alive testing (SPA) Enable" = Enabled

Danger!

In order to ensure safety-related monitoring of the encoder/motor connection, all three parameters "Encoder monitoring - Position error monitoring - Enable", "Encoder monitoring - Speed error monitoring - Enable" and "Encoder monitoring - Position setpoint alive testing (SPA) - Enable" must be set to "Enabled"!

If this is not the case, then the monitoring system cannot be used for safety purposes and a mechanical solution for detecting errors must be implemented!

2.3.3.3.2 Configuration rule for position lag error tolerance⁷⁾

The position lag error tolerance must be set large enough to ensure availability. This can be done by first measuring the position lag error under the highest influence of disturbance variables and at maximum acceleration and then setting the position lag error tolerance accordingly higher.

Danger!

The position lag error tolerance is not permitted to be higher than half of one pole length!

If the safety function is activated, the size of the position lag error tolerance value affects how long it will take to look for errors and therefore also the error response time and estimation of the residual distance.

This must be taken into account by the machine manufacturer in the risk analysis!

Information:

Due to rounding errors, a reserve of 1 unit should be taken into account with the parameter "Encoder monitoring - Position error tolerance".

⁶⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

⁷⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

2.3.3.3.3 Configuration rule for speed error tolerance⁸⁾

The speed error tolerance must be set large enough to ensure availability.

This can be done by first measuring the speed error under the highest influence of disturbance variables and reference variables (e.g. at maximum acceleration) and then setting the speed error tolerance accordingly higher.

Danger!

When the safety function is enabled, the size of the speed error tolerance value affects how long it will take to look for errors and therefore also the error response time and estimation of the residual distance.

This must be taken into account by the machine manufacturer in the risk analysis!

Information:

Due to rounding errors, a reserve of 1 unit/s should be taken into account with the parameter "Encoder monitoring - Speed error tolerance".

⁸⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

2.4 Safe speed observer

Information:

A non-safe encoder (onboard or plug-in card) is necessary to check the plausibility of the safely observed speed.

Information:

No safe position is determined. Safety functions that need a safe position cannot be used in combination with the safe speed observer.

The safe speed observer SSO monitors the actual speed of a synchronous motor. Safe evaluation of the phase currents and PWM pulse widths and knowledge of the motor characteristics ensures reliable evaluation of the motor speed.

For additional information, see 4.5 "Safe Speed Observer, SSO" on page 335.

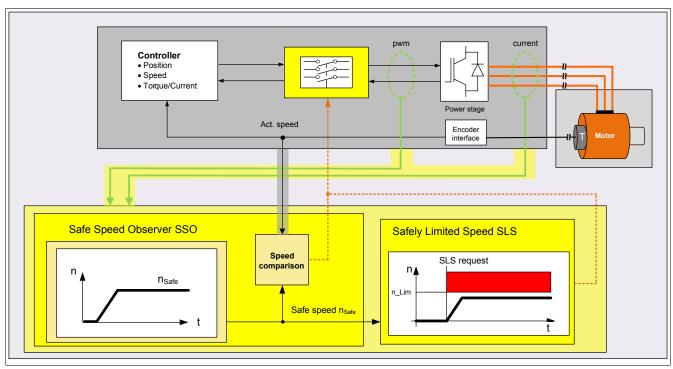

Figure 68: Safe Speed Observer (SSO) - General functional description

2.5 Safe current measurement

Safe current measurement is a component of safety functions SBT, SLT and SSO.

2.5.1 Accuracy of current measurement

The accuracy of the current measurement depends on the permissible measurement error of the current transformers. This is specific to the performance class of the inverter module used.

Danger!

The accuracy of the safe current indicates the maximum undetectable/undiagnosable error of the amount of the safe current space vector. This error must be taken into account in the configuration of safety functions SBT and SLT.

Danger!

The accuracy of the safe current only applies up to the continuous current of the performance class used. It is not permitted to use a safety function that should monitor or detect a current above the continuous current of the performance class used.

For ACOPOSmulti SafeMOTION SinCos, the following table applies to the accuracy of the safe current:

Performance class (ACOPOSmulti)	Continuous current [A]	Accuracy of the safe current
8BVI0014HxSA	1.9	108.6 mA
8BVI0028HxSA	3.8	293 mA
8BVI0055HxSA	7.6	488.2 mA
8BVI0110HxSA	15.1	976.6 mA
8BVI0220HxSA	22	1101.6 mA
8BVI0330HxSA	33	2406.4 mA
8BVI0440HxSA	44	2406.4 mA
8BVI0660HxSA	66	4.813 A
8BVI0880HxSA	88	4.813 A
8BVI1650HxSA	165	7.344 A

Information:

The accuracy of the safe current for the ACOPOS P3 SafeMOTION servo drive is specified in the respective data sheet.

3 Safety characteristics of integrated safety functions

The safety characteristics have been calculated for the individual safety functions and grouped together in the following blocks:

- · Safe Torque Off (STO), Safe Stop 1 (SS1) time-monitored
 - → The two safe pulse disabling channels and their activation are included in evaluation.
- Safe Torque Off (STO1) single-channel
 - → Only one safe pulse disabling channel and its activation are included in evaluation.
- Safe Brake Control (SBC)
 - → The safe motor brake output and its activation are included in the evaluation. The brake itself must be taken into account explicitly in the safety chain!
- Safe Operating Stop (SOS), Safe Stop 1 (SS1) speed-monitored, Safe Stop 2 (SS2), Safely Limited Speed (SLS), Safe Direction (SDI), Safely Limited Increment (SLI), Safely Limited Acceleration (SLA), Safe Maximum Speed (SMS), Safely Limited Position (SLP), Safe Maximum Position (SMP), Safe Homing, Remanent Safe Position (RSP)
 - \rightarrow The two safe pulse disabling channels and their activation are included in evaluation. Safe evaluation of the encoder, safe position detection and the safe motor holding brake output and its activation are also taken into consideration.

The safety characteristics of the encoder itself must also be taken into account!

- Safe Brake Test (SBT)
 - → The two safe pulse disabling channels and their activation are included in evaluation. Safe evaluation of the encoder, safe position detection, safe current measurement and the safe motor holding brake output and its activation are also taken into consideration.

The safety characteristics of the encoder itself must also be taken into account!

The brake itself must be taken into account explicitly in the safety chain.

- Safely Limited Torque (SLT)
 - \rightarrow The two safe pulse disabling channels and their activation are included in evaluation. Furthermore, the safe current measurement and safe motor holding brake output as well as its control are also taken into account.
- Safely Limited Speed (SLS with SSO)
 - → The two safe pulse disabling channels and their activation are included in evaluation. Furthermore, the safe current measurement, PWM measurement and safe motor holding brake output as well as its control are also taken into account.

Danger!

To determine the overall PFH value for safety functions that require safe encoder evaluation, the PFH value of the encoder being used must be taken into account.

For a detailed description, see 2.3.1 "Assessing the safety integrity of the overall system" on page 295!

PFH_{TOTAL} = PFH_{SOS,SS1,SS2,SLS,SMS,SDI,SLI,SLA,SLP,SMP} + PFH_{Encoder}

Danger!

It is the machine manufacturer's responsibility to read and adhere to the technical documentation (product catalog / user's manual) provided for the measuring instrument.

Danger!

If the technical documentation (product catalog / user's manual) for the measuring instrument explicitly specifies that the bit error rate must be verified, then the user needs to implement this verification procedure in the application. This verification is not necessary if using B&R EnDat 2.2 encoder cables and certain B&R motors.

SafeMOTION User's Manual V 4.6.1

3.1 Safety characteristics of integrated safety functions ACOPOSmulti SafeMOTION EnDat 2.2

Safety function	Criteria	Characteris	Characteristic dependent on module width		
		1	2	4	8
Safe Torque Off (STO),	Maximum safety category per EN ISO 13849	Cat. 4			
Safe Stop 1 (SS1), time-monitored	Maximum performance level per EN ISO 13849	PL e			
	Maximum safety integrity level per IEC 62061	SIL 3			
	Maximum safety integrity level per IEC 61508	SIL 3			
	PFH (probability of dangerous failure per hour)	<5*10 ⁻¹⁰			
	PFD (probability of dangerous failure on demand) with a proof	<9*10 ⁻⁰⁵			
	test interval of 20 years				
	PTI (proof test interval) 2)	Max. 20 yea	rs		
	DC (diagnostic coverage)	>95%			
	MTTFd (mean time to dangerous failure) 3)	2500 years			

Table 186: Safety characteristics: Safe Torque Off (STO), Safe Stop 1 (SS1) time-monitored

- 1) ACOPOSmulti inverter modules have different module widths according to their performance class. Different components and/or switching elements are used depending on the performance class / module width, which has a direct effect on the characteristics of safe pulse disabling. The module width is listed in the technical data for the respective ACOPOSmulti inverter module.
- 2) Corresponds to the mission time of the module.
- 3) Value determined according to Apfeld, R.; Bömer, T.; Hauke, M.; Huelke, M.; Schaefer, M.: Practical experience with DIN EN ISO 13849-1.openautomation (2009) No. 6, p. 34-37 (www.dguv.de/ifa/de/pub/grl/pdf/2009_249.pdf).

Safety function	Criteria	Characteris	Characteristic dependent on module width 1)		
		1	2	4	8

- 1) Safe encoder evaluation is not necessary in conjunction with SSO.
- 2) Supported in hardware upgrade 1.10.2.x and later in conjunction with SSO.

Guidelines for using the integrated safety functions

ACOPOSmulti SafeMOTION and ACOPOSmotor SafeMOTION

At least the "Activate" and "S_AxisID" inputs must be connected. Otherwise, the SafeMOTION module will not be operated by the SafeLOGIC controller. As a result, pulse disabling and the motor holding brake output will be permanently set to 0 V, which means that the controller cannot be switched on.

ACOPOS P3 SafeMOTION

For each axis used, at least the inputs "Activate", "S_AxisID", and "S_Control_Activate" must be connected to the function block SF_oS_MOTION_Basic_BR or SF_oS_MOTION_BR.

Danger!

All of the safety functions that are being used must be tested.

A function is considered to be "in use" if the corresponding input is connected or the safety function has been configured!

The following libraries and function blocks are available in SafeDESIGNER for creating a safe application.

Safety technology • Integrated safety functions

4.1 FAIL SAFE state

4.1.1 Parameters

None

4.1.2 Behavior

If a hardware or firmware error occurs, then the SafeMOTION module switches to a non-acknowledgeable error state – the FAIL SAFE state. The logbook entry in Automation Studio provides more detailed information about the pending error. This logbook can also be evaluated in the standard application.

If the hardware is defective, the entire ACOPOSmulti SafeMOTION inverter module, entire ACOPOS P3 SafeMOTION servo drive or entire ACOPOSmotor SafeMOTION module must be replaced.

Information:

SafeMOTION modules cannot be replaced! The SafeMOTION module forms a unit with the ACOPOSmulti SafeMOTION inverter module, ACOPOS P3 SafeMOTION servo drive or inverter unit in the ACOPOSmotor SafeMOTION module. In the event of an error, the entire module must be replaced.

An error may also have been caused by a configuration mistake, however. If this is the case, then the safe configuration must be checked and reloaded to the SafeLOGIC controller. This must then be followed by a power off/on cycle to bring the module back to the OPERATIONAL state.

Danger!

In state "FAIL SAFE", safe pulse disabling is always active, i.e. the drive is not supplied with power; the motor therefore no longer exerts torque or force. The motor holding brake output is always switched to 0 V in this state!

Danger!

Constantly lit "SE" LEDs indicate a non-acknowledgeable FAIL SAFE state. The cause of this could be a defective module or faulty configuration.

Check the entries in the logbook! If you are able to rule out a faulty configuration, then the module is defective and must be replaced immediately.

It is your responsibility to ensure that all necessary repair measures or corrections to the configuration are initiated after an error occurs since subsequent errors can result in dangerous situations!

Danger!

ACOPOSmulti SafeMOTION inverter modules

If connected, the motor holding brake engages in the FAIL SAFE state. The motor holding brake will suffer mechanical wear if the motor is in motion just before the safe state is triggered. This must be taken into account when selecting and dimensioning the motor holding brake (emergency stop capability).

4.2 FUNCTIONAL FAIL SAFE state

4.2.1 Parameters

Table 210: SafeMOTION parameter group: General settings - Behavior of Functional Fail Safe (FFS)

4.2.2 Behavior

If a monitored limit is exceeded or an encoder error occurs during operation – and as long as the safe encoder is required for the safety functions being used – then the SafeMOTION module switches to an acknowledgeable error state – the FUNCTIONAL FAIL SAFE state.

For information about any errors that occur, see the logbook entry in Automation Studio. This logbook can also be evaluated in the standard application.

Danger!

The motor holding brake is engaged in the FUNCTIONAL FAIL SAFE state. The motor holding brake will suffer mechanical wear if the motor is in motion just before the safe state is triggered. This must be taken into account when selecting and dimensioning the motor holding brake (emergency stop capability).

Danger!

The error response time specified in the manual affects the residual movement in the event of error! This must be taken into account when planning the safety equipment (e.g. distances, monitored limits, etc.)

"FFS - Mode" = "STO"

Pulse disabling is requested (low-side and high-side) immediately after the error is detected and the safe motor holding brake output is set to 0 V.

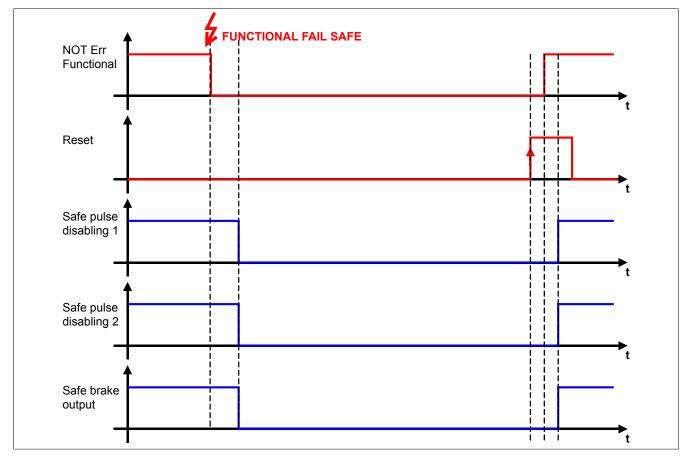

Figure 69: FUNCTIONAL FAIL SAFE - STO configuration

"FFS - Mode" = "STO1 and STO with time delay"

Either the low-side or high-side of the pulse disabling is switched to 0 V immediately after the error is detected. The safe motor holding brake output is set to 0 V after the configured "FFS - STO Enable delay time" (t_{FFS_STO}) has expired.

The second channel of the pulse disabling is also switched to 0 V after the configured "FFS - STO Enable delay time until brake engages" (t_{FFS BRAKE}) has expired.

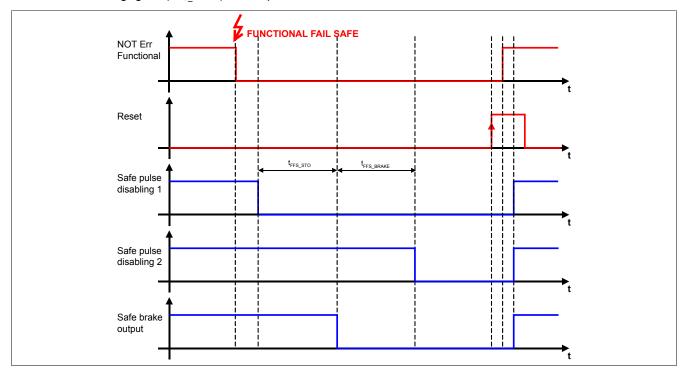

Figure 70: FUNCTIONAL FAIL SAFE - STO1 and STO configuration with time delay

This makes it possible for the drive to be decelerated via the short circuit braking integrated in the inverter unit for the amount of time in which just one pulse disabling channel is active.

In this case, the time $t_{\text{FFS_BRAKE}}$ serves to incorporate this brake engage time. This means that the second pulse disabling channel will only be switched to 0 V after the motor holding brake has actually engaged.

Danger!

Short circuit braking in the inverter unit is not suitable for safety purposes and can therefore only be used to protect the machine. If the release of motor energy could result in dangerous situations (e.g. with hanging loads), then a mechanical safeguard must also be installed.

"FFS - Caused by encoder error"

This parameter makes it possible to disable the FUNCTIONAL FAIL SAFE reaction to an encoder error if no safety function is active that requires an encoder (safe position and/or safe speed).

4.3 Blackout mode

Information:

This functionality is only available in hardware upgrade 1.10.2.x or later!

Information:

If safety functions are configured for blackout mode, they are used as configured in SafeDESIGNER. The danger warnings of individual safety functions also apply when used in blackout mode.

Danger!

Enabling blackout mode can lead to dangerous situations since pulse disabling is only enabled when the safety function is triggered or after delay time "BM - Delay time to FFS" has elapsed and not immediately when the network fails.

Information:

In the event of network failure of the servo drive, it is no longer possible to react to error behavior of the drive in the standard application. The standard default error response in the event of network failure is to abort the movement. An active standard reaction is only possible if safety communication fails.

Danger!

Parameter "Automatic reset on start" enables/disables the restart interlock during startup or when a network failure occurs on a reestablished network connection.

If parameter "Automatic reset on start" is set to "Enabled", then the module automatically changes to state OPERATIONAL state (i.e. pulse disabling and the motor holding brake are enabled)!

Configuring an automatic restart can result in critical safety conditions. Take additional measures to ensure proper safety-related functionality.

Information:

Resuming the network connection does not interrupt blackout mode functionality. Short interruptions and disturbances of the network connection therefore also result in the enabling of blackout mode.

Table 211: SafeMOTION parameter group: General settings - Blackout Mode

SafeMOTION User's Manual V 4 6 1

4.3.2 Behavior

If no valid openSAFETY telegrams are received during operation, either the configured blackout mode with subsequent FUNCTIONAL FAIL SAFE state is enabled or the system changes immediately to state IDLE of the state machine of the SafeMOTION module; this depends on the configuration of parameter "BM - Mode". In the event of failure of the safety communication, this function makes it possible to start a retraction movement in the standard application and to monitor it using suitable safety functions, for example.

4.3.2.1 Configuration of parameter "BM - Mode"

BM - Mode = Off

This is the default setting. As before, the module changes to state IDLE of the state machine of the SafeMOTION module immediately after no more valid openSAFETY telegrams are received. In state IDLE, the motor holding brake output and pulse disabling are enabled.

BM - Mode = Prev. enabled SF

If no more valid openSAFETY telegrams are received, the safety functions requested at the time of the last valid telegrams remain active for the configured time "BM - Delay time to FFS". If a monitored limit is exceeded during this time, the module immediately changes to state FUNCTIONAL FAIL SAFE. Otherwise, the module changes to state FUNCTIONAL FAIL SAFE only after the time "BM - Delay time to FFS" has elapsed. The FUNCTIONAL FAIL SAFE error response is initiated as described above (see 4.2 "FUNCTIONAL FAIL SAFE state" on page 326).

BM - Mode = Prev. enabled and configured SF

If no more valid openSAFETY telegrams are received, the safety functions requested at the time of the last valid telegrams remain active for the configured time "BM - Delay time to FFS". In addition, the safety functions configured under "BM - Configured safety functions" are requested. If a monitored limit is exceeded during the active safety functions, the module immediately changes to state FUNCTIONAL FAIL SAFE. Otherwise, the module changes to state FUNCTIONAL FAIL SAFE only after the time "BM - Delay time to FFS" has elapsed. The FUNCTIONAL FAIL SAFE error response is initiated as described above (see 4.2 "FUNCTIONAL FAIL SAFE state" on page 326).

BM - Mode = Configured SF

If no more valid openSAFETY telegrams are received, the safety functions configured under "BM - Configured safety functions" remain activated for the configured "BM - Delay time to FFS" time. If a monitored limit is exceeded during this time, the module immediately changes to state FUNCTIONAL FAIL SAFE. Otherwise, the module changes to state FUNCTIONAL FAIL SAFE only after the time "BM - Delay time to FFS" has elapsed. The FUNCTIONAL FAIL SAFE error response is initiated as described above (see 4.2 "FUNCTIONAL FAIL SAFE state" on page 326).

4.3.2.2 Configuration of parameter BM - Configured safety functions

Parameter "BM - Configured safety functions" can be used to configure the safety functions that are requested (additionally) when blackout mode is active.

The following must be taken into account during configuration:

- Only functions that are also used in the safe application are permitted to be configured; the corresponding
 input on the function block must be connected and the function parameters must be set correctly. If this is
 not observed, the SafeMOTION module changes to state FAIL SAFE after startup.
- A function is configured by setting the corresponding bit in the control word to 0; unused bits must have the value 1. By default, all bits are set to 1, i.e. no function is configured!
- Safety functions that are not contained in the control word remain enabled/disabled as configured.
- The following control bits are not permitted (these are not evaluated):
 "Control reset", "Control activate", "Control SBT", "Control homing", "Control RefSwitch", "Control Switch-HomingMode" and all "Reserved" bits.

The assignment of safety functions to the respective control bit is shown in the tables:

- Tab. 305 "Control bits Byte 0" on page 475
- Tab. 306 "Control bits Byte 1" on page 475
- Tab. 307 "Control bits Byte 2" on page 475
- Tab. 308 "Control bits Byte 3" on page 476

(previously Maximum acceler- ation (rad/s² or mm/s²))					

Table 212: SafeMOTION parameter group: General settings - Encoder Unit System

SafeMOTION User's Manual V 4.6.1

Information:

The physical drive speed is not permitted to exceed the value set for parameter "EUS - Maximum speed to normalize speed range"; otherwise, the SafeMOTION module will switch to the error state!

Danger!

If the manufacturer of the measuring instrument specifies a limitation of the maximum acceleration, this must be monitored by the SafeMOTION module. The acceleration to be monitored can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Incorrectly configuring the unit system can result in dangerous situations.

When validating the application, the monitored speed limits must be intentionally violated and their physical values tested! The same must also be done for the monitored direction of rotation!

4.4.2 Behavior

These parameters (see 4.4.1 "General settings - Encoder Unit System" on page 331) can be used to configure the safe unit system.

The safe speed and safe position are transferred in the safety frame. The process data is only permitted to be used together with the corresponding status bit. If the respective status bit is FALSE, then the corresponding data is invalid.

Function blocks are available that can link the process data to a specific axis in order to use it in the safety application.

Safe Position

The safe position is transferred in the [units] defined by the configured units system. After successful homing, status bit "S_SafePositionValid" or "S_Status_Homing" is set.

Danger!

If the position signal is not validated, then an invalid position could be used in the safety application. This can result in hazardous situations!

Danger!

The safe encoder evaluation can only detect a transmission or positioning error if:

- A path is traversed greater than the angular deviation of the safe position specified in the encoder manufacturer's product information (applies to ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION or ACOPOSmotor SafeMOTION).
- A distance is traversed that is greater than ±½ of the signal period of the SinCos measuring instrument (applies to ACOPOSmulti SafeMOTION SinCos).

The resulting maximum error in the safe position also depends on the length of the physical reference system (revolutions, length of the scale, etc.).

The error affects the minimum clearance required to prevent pinching/crushing (e.g. of fingers) and must be taken into account when dimensioning the safety function.

Danger!

For a frictionally engaged connection with fault exclusion, there is no additional mechanical offset that would need to be considered for the safe position.

If fault exclusion is fulfilled only by a mechanical stop with backlash, this maximum possible offset must be calculated into the safe position. This is done by adding the values for the measuring instrument and for the mechanical coupling.

Safe Speed

The safe speed is scaled to 2 bytes due to the limited bandwidth available in the safety frame. The scaled speed (v_{Scaled}) is calculated as follows:

$$v_{scaled} = \frac{v_{physical} \cdot 32767}{v_{EUS_MAX_NORM}} \left[\frac{scaled\ units}{s} \right]$$

v_{Physical} (physical speed) corresponds to the actual physical value and is calculated in [units/s] using the configured units system.

With the default configuration of parameter "EUS - Maximum speed to normalize speed range" = $v_{\text{EUS_MAX_NORM}}$ = 32767, the scaled speed equals the physical speed!

The maximum speed is never permitted to exceed the configured value of "EUS - Maximum speed to normalize speed range"; otherwise, the module switches to the FUNCTIONAL FAIL SAFE state.

Information:

The speed limits of safety functions are configured in [units/s] of physical speed. The safety functions monitor the scaled speeds [scaled units/s] internally, which can cause scaling errors to occur.

Example

The following configuration results in the speed tolerance for standstill monitoring being scaled internally to 0 [scaled units/s].

Configuration:

"EUS - Maximum speed to normalize speed range" = v_{EUS MAX NORM} = 3276700

"Standstill monitoring - Speed tolerance" = $v_{SM T}$ = 20

Scaled
$$v_{SM_T} = \frac{v_{SM_T} \cdot INT16MAX}{v_{EUS_MAX_NORM}} = \frac{20 \cdot 32767}{3276700} = 0$$

If Safe Operating Stop is activated, a speed tolerance of 0 is monitored internally [scaled units/s]. This can wrongly result in a speed limit violation while at a standstill.

Information:

The configured unit system has a significant impact on the maximum physical speed that is achieved.

When changing the configured unit system, it is important to consider how this will affect parameter "EUS - Maximum speed to normalize speed range".

Danger!

If the module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state, then the drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. Output "S_NotErrFUNC" or "S_Status_NotErrFunc" of the function block is reset!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Danger!

If the speed signal is not validated, then an invalid speed value could be used in the safety application. This can result in hazardous situations!

Danger!

The safe encoder evaluation can only detect a transmission or positioning error if:

- A path is traversed greater than the angular deviation of the safe position specified in the encoder manufacturer's product information (applies to ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION or ACOPOSmotor SafeMOTION).
- A distance is traversed that is greater than ±½ of the signal period of the SinCos measuring instrument (applies to ACOPOSmulti SafeMOTION SinCos).

The resulting maximum error in the safe position also depends on the length of the physical reference system (revolutions, length of the scale, etc.).

The error influences the error response time and must be taken into account when dimensioning the safety function.

4.5 Safe Speed Observer, SSO

Information:

This functionality is only available for ACOPOS P3 SafeMOTION with hardware upgrade 1.10.2.x or later!

The function is approved starting with a defined hardware revision; for older hardware revisions, using the safety function leads directly to state FAIL SAFE. The necessary hardware revision is noted in the servo drive data sheet.

4.5.1 Parameter

Parameter	Unit	Description	Default value	Starting in Safety Release

EUS - Units per count of physical reference system (previously <i>Units per count of physical reference system [units]</i>)	[units]	Rotary encoder unit scale: Units per x revolutions Linear encoder unit scale: Units per x reference lengths Any unit (mm, 1/100 mm, 1/20 inch, degree of angle, etc.) can be used for positions (and data that can result such as speed and acceleration). For this reason, the relationship between an integer multiple of this unit (units per x revolutions / units per x reference lengths) and a certain number of x revolutions / x reference lengths has to be previously defined.	1000	R 1.4

Table 213: SafeMOTION parameter group: General settings - Encoder Unit System

SafeMOTION User's Manual V 4.6.1

Safety technology • Integrated safety functions

Parameter	Unit	Description		Default value	Starting in Safety Release
EUS - Counting direction	Standard /	Counting dire	ection of the position or speed	Default	R 1.3
	Inverse	Value	Description		
(previously Counting direction)		Default	Encoder counting direction is equal to the counting direction of the unit system.		
		Inverse	Encoder counting direction is negative to the counting direction of the unit system.		
EUS - Length of physical ref- erence system for linear en- coder (previously Length of physical reference system for linear en- coder (nml)	[nm]	tem is define This value is	For linear measurement systems, the length of a physical reference system is defined here. This value is not used for rotary encoders, where the reference system is a single revolution.		R 1.4
EUS - Maximum speed to normalize speed range (previously Maximum speed to normalize the speed range (units/s))	[units/s]	Maximum sp	Maximum speed to which the displayed speed should be normalized		R 1.3
EUS - Encoder acceleration limit (previously Maximum acceler- ation (rad/s² or mm/s²))	[rad/s²] or [mm/s²]	Maximum pe	rmissible encoder acceleration	100000	R 1.4

Table 213: SafeMOTION parameter group: General settings - Encoder Unit System

Information:

Parameter "EUS - Encoder acceleration limit" does not have to be configured when using the safe speed observer since acceleration is not monitored.

Parameter	Unit	Description	Default value	Starting in Safety Re-
Motor - Number of pole pairs (hardware upgrade 1.10.2.x and later)	-	Number of pole pairs on the rotor circumference	1	1.10
Motor - Direction*) (hardware upgrade 1.10.2.x and later)	Standard / Inverse	Direction of rotation of the motor	Standard	1.10
Motor - Stator resistance (hardware upgrade 1.10.2.x and later)	mOhm	Ohmic stator resistance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Stator inductance (hardware upgrade 1.10.2.x and later)	μH	Stator inductance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Torque constant (hardware upgrade 1.10.2.x and later)	μNm / A	Torque constant of the motor	0	1.10
Motor - Rated speed (hardware upgrade 1.10.2.x and later)	units/s	Nominal speed of the motor	0	1.10
Motor - Stall current (hardware upgrade 1.10.2.x and later)	mA	Stall current of the motor	0	1.10
Motor - Rated current (hardware upgrade 1.10.2.x and later)	mA	Nominal current of the motor	0	1.10
Motor - Peak current (hardware upgrade 1.10.2.x and later)	mA	Peak current of the motor	0	1.10
Motor - Stall torque (hardware upgrade 1.10.2.x and later)	mNm	Stall torque of the motor that is output when the stall current is applied	0	1.10
Motor - Peak torque (hardware upgrade 1.10.2.x and later)	mNm	Peak torque of the motor that is briefly output when the peak cur- rent is applied	0	1.10
Motor - Moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	Mass moment of inertia of the motor. Consists of the sum of the inertias of the rotor, encoder and holding brake.	0	1.10
Motor - External moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	External mass moment of inertia, depends on the total external load	0	1.10

Table 214: SafeMOTION parameter group: General settings - Motor

Information:

Parameters "Motor - Peak torque", "Motor - Moment of inertia" and "Motor - External moment of inertia" are optional for the safe speed observer! The quality of the safe speed can be improved by configuring it.

^{*)} The direction of rotation of the motor is not related to the counting direction of the speed ("EUS - Counting direction"), i.e. the direction of rotation of the motor can be changed explicitly in the non-safe application and must therefore also be taken into account in SafeDESIGNER.

Information:

An incorrect configuration ("Motor - Peak torque" too small, "Motor - Moment of inertia" or "Motor - External moment of inertia" too large) can lead to a deceleration of the observed speed and thus influence the "SSO - Speed tolerance safe speed".

Information:

If the direction of rotation of motor "Motor - Direction" is inverted, the commutation offset of the motor must be newly determined by single-phase.

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
SSO - Speed tolerance safe speed (hardware upgrade 1.10.2.x and later)	% of the nominal speed of the motor	Permissible dev encoder speed	viation of the observed safe speed from the actual	10	1.10
SSO - Inverter switching frequency (hardware upgrade 1.10.2.x and later)	Hz	Switching frequency of the servo drive		5000	1.10
SSO - Inverter adjustment amplifica- tion factor (hardware upgrade 1.10.2.x and later)	10-3	Correction of the normalized gain factor of the inverter characteristic curve		0	1.10
SSO - Inverter adjustment exponent (hardware upgrade 1.10.2.x and later)	10 ⁻³ / A	Correction of the exponent of the inverter characteristic curve		0	1.10
SSO - External load - Enable (hardware upgrade 1.10.2.x and later)	Enabled/Disabled	Uses external energies (external load or suspended axes) with an enabled observer		Enabled	1.10
		Value	Description		
		Enabled	An external load / suspended load is used.		
		Disabled	No external load / suspended load is used.		

Table 215: SafeMOTION parameter group: General settings - SSO

Information:

Parameters "SSO - Inverter adjustment amplification factor" and "SSO - Inverter adjustment exponent" must be determined using a parameter identification procedure (see 4.5.2.2.2 "Parameter identification for determining parameters "SSO - Inverter adjustment amplification factor" and "SSO - Inverter adjustment exponent"" on page 341)! Both parameters are used to correct the power inverter losses in the phase voltages.

Group: General settings - Encoder monitoring (previously Encoder Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Release
Encoder monitoring - Safe En-	From motor data	Status of the proof	of fatigue strength of the encoder mounting	From motor data	R1.10
coder Mounting (Hardware up-	record / Approved	Value	Description	record	
grade 1.10.3.x and later)	by user	From motor data record	The status of the encoder mounting is determined using the motor data record.		
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.		
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the lule	Enabled	R1.3
		Value	Description		
(previously Encoder Position		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Speed error monitoring - Enable	Enabled/ Disabled		Activates/Deactivates monitoring of the speed error generated on the SafeMOTION module		
		Value	Description	,	
(previously Encoder Speed		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Position setpoint alive testing (SPA) -	Enabled/ Disabled	Activates/Deactivates the monitor that detects whether the position setpoint generated on the SafeMOTION module is frozen.		Disabled	R1.3
Enable		Value	Description		
(annuincely Ontonoliting alive		Enabled	Monitoring active		
(previously Set position alive testing)		Disabled	Monitoring not active		
Encoder monitoring - Position error tolerance (previously <i>Encoder monitor</i> -	[units]	Position lag error tolerance for shaft breakage monitoring		0	R1.3
ing Position tolerance (units))					
Encoder monitoring - Speed error tolerance	[units/s]	Speed error tolera	nce for encoder monitoring	0	R1.3
(previously Encoder monitor- ing Speed tolerance (units/s))					

Table 216: SafeMOTION parameter group: General settings - Encoder monitoring

Information:

Velocity lag error monitoring "Encoder monitoring - Speed error monitoring - Enable" must be enabled for the safe speed observer, and tolerance "Encoder monitoring - Speed error tolerance" must be configured.

Information:

Speed lag error monitoring compares the speed setpoint with the measured actual speed in order to rule out an error in the encoder mounting. The following regulation applies to speed error tolerance "Encoder monitoring - Speed error tolerance":

"Encoder monitoring - Speed error tolerance" ≤ "EUS - Maximum speed to normalize speed range" It makes sense that "Encoder monitoring - Speed error tolerance" should be less than "SSO - Speed tolerance safe speed".

Information:

Position lag error monitoring "Encoder monitoring - Position error monitoring - Enable" is not permitted to be enabled for the safe speed observer.

4.5.2 Behavior

For certain applications, it is possible to use the safe speed observer (SSO) instead of a safe encoder. The speed of an axis is determined by means of electrical signals and checked for plausibility with the measured values of non-safe encoder.

It is guaranteed that the speed determined and output by the safe speed observer is within the specified tolerance window of ±"SSO - Speed tolerance safe speed" around the actual speed and can therefore be used to monitor a speed limit using safety function SLS.

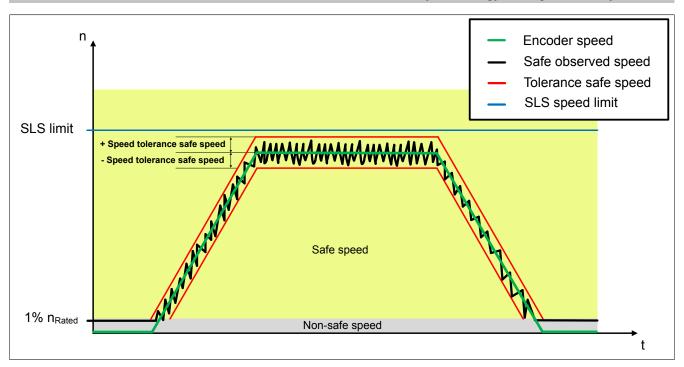

Figure 71: Comparison of the safely observed speed with the actual speed

Information:

The minimum safe speed output corresponds to 1% of the configured nominal speed of the motor!

The observable minimum speed is approx. 1% of the nominal speed. The tolerance, i.e. ±"SSO - Speed tolerance safe speed", depends on the motor used and the dynamics of the application and is typically ~2% of the nominal speed for rotary motors and ~20% for linear motors.

Information:

The minimum configurable tolerance "SSO - Speed tolerance safe speed" corresponds to 1% of the configured nominal speed of the motor! If the size selected for the parameter is too small, the availability of the axis is reduced.

Information:

The minimum configurable speed limit is not permitted to be less than the configured tolerance "SSO - Speed tolerance safe speed"!

The following rule applies:

1% $n_{rated} \le Tolerance$ safe speed $\le LIM_{SOS} \le LIM_{SLS4} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le EUS$ - Maximum speed to normalize speed range

Information:

Safety function Safe Maximum Speed "Speed functions - SMS/SLS - SMS - Enable" is not permitted to be used in combination with the safe speed observer. Safety function SMS is active immediately after changing to state OPERATIONAL. However, the SSO can only form a safe speed after the controller has been switched on for the first time and a safety-critical time window would be created.

Danger!

The permissible speed tolerance "SSO - Speed tolerance safe speed" must be determined by the user and configured in SafeDESIGNER.

Together with the safely configured nominal speed, the minimum, safely observable speed is thus defined. The speed determined in this way also corresponds to the error to be assumed.

When creating the safe application, this must be taken into account in such a way that the speed limit to be monitored is selected correspondingly lower!

Safety technology • Integrated safety functions

Only the Safe Speed can be determined, but not the Safe Position, see 4.4 "Safe Position, Safe Speed" on page 331. Together with the achievable tolerance, this results in a limitation of the permissible safety functions when using the safe speed observer. Safe monitoring of the standstill is **not** possible!

The safe speed observer adds the SLS safety function to the permissible safety functions without a safe encoder.

The necessary requirements for using the safe speed observer are as follows:

- Use of a synchronous motor (linear or rotary) and knowledge of the motor characteristics
- Evaluation of a non-safe encoder
 - The encoder must be supported by the drive (onboard or option board).
 - ° Using a crosslink axis encoder is not permitted.
 - Network encoders are not permitted.
 - Use of a standard observer (encoderless control) is not permitted.
- Control modes such as current control mode and V/f control mode are not permitted.
- Load impacts can only be observed by the observer under certain circumstances; they usually have a direct effect on permissible speed tolerance "SSO Speed tolerance safe speed".

4.5.2.1 External energies / External loads / Suspended axes / Vertical axes

External energies / Suspended loads must be explicitly configured when using SSO ("SSO - External load - Enable" → Enabled/Disabled). The following must be observed:

SSO - External load - Enabled

A safety function that requires a safe speed can only be requested when the controller is switched on. If SLS is requested and the controller is switched off, for example, the SafeMOTION module immediately changes to state FUNCTIONAL FAIL SAFE since the safe speed loses its validity.

Information:

When using an external load, safety function Safe Stop 1 (SS1) is only permitted to be used with pure time monitoring. A ramp-monitored stopping procedure ("SS1 - Ramp monitoring - Enable") and early limit monitoring ("Early limit monitoring - Enable") are not permitted to be enabled.

SSO - External load - Disabled

When the controller is switched off, the current safe speed is "frozen". This is permitted since the system cannot accelerate without external energy.

If the speed limit to be monitored is greater than the "frozen" speed, the safety function can be requested as usual.

If this is not the case, a request from the safety function leads to a violation of the monitored speed and the SafeMOTION module changes to state FUNCTIONAL FAIL SAFE.

Danger!

The user is responsible for ensuring that the requirements for the safe observer (SSO) are met.

Otherwise, the use of the safe speed observer is not permitted!

Before using the Safe Speed Observer, the necessary safety functions and their limits must be defined. Subsequently, it must be decided whether the requirements of the safety functions can be fulfilled by means of SSO.

4.5.2.2 Commissioning

Before using the safe speed observer, the necessary parameters must first be determined. To do this, make the following settings in SafeDESIGNER:

- The use of an encoder must be disabled ("EUS Encoder type" → Encoder not used)
- · No safety function is permitted to be activated.

The following setting must be changed in the encoder configuration of the servo drive:

Drive configuration → Encoder configuration → Encoder X4x → Interface type:
 The encoder type used must be configured here. Setting "EnDat SafeMOTION" must be deselected; otherwise, the standard (non-safe) firmware expects a safe encoder and therefore returns an error.

4.5.2.2.1 Reading parameters in Automation Studio

Information:

For a B&R motor with an EnDat interface type, the motor parameter set can be read out in the encoder memory using ParIDs. Before reading, make sure that interface type "EnDat" (see 4.5.2.2 "Commissioning" on page 340) is selected when configuring the plug-in module, otherwise the motor parameter set of the simulation is read out incorrectly.

The motor parameters and inverter switching frequency can be read out in Automation Studio using ParIDs. Some of them can also be found on the nameplate or in the motor data sheet.

Parameter	Necessary unit	Description	Configuration in SafeDESIGNER
Motor - Number of pole pairs	-	Number of pole pairs on the rotor circumference	PariD 47
Motor - Stator resistance	mOhm	Ohmic stator resistance measured be- tween two connections (phase - phase) of the motor	
Motor - Stator inductance	μН	Stator inductance measured between two connections (phase - phase) of the motor	
Motor - Torque constant	μNm/A	Torque constant	ParID 55 * 106
Motor - Rated speed	units/s	Nominal speed of the motor	*)
Motor - Peak torque	mNm	Peak torque of the motor that is briefly output when the peak current is applied	
Motor - Moment of inertia (optional)	µkgm²	Mass moment of inertia of the motor. Consists of the sum of the inertias of the rotor, encoder and holding brake.	ParID 62 * 10 ⁶

^{*) = \}frac{ParID50 \cdot "EUS - Units per count of physical reference system"}{60 \cdot "EUS - Count of physical reference system"}

4.5.2.2.2 Parameter identification for determining parameters "SSO - Inverter adjustment amplification factor" and "SSO - Inverter adjustment exponent"

Due to the non-ideal switching behavior of the servo drive, the output voltage is falsified. Parameters "SSO - Inverter adjustment amplification factor" and "SSO - Inverter adjustment exponent" are needed to correct the resulting switching losses.

Both parameters must first be determined using an identification procedure and can only be read out afterwards.

- The controller must be tuned in Automation Studio as usual ("Controller Autotuning")
- Parameter identification is started by writing the following ParIDs:

Parameter ID name	ParID	Value	Description
PIDENT_MOTOR_TYPE	975	2 (for SM)	Motor: Type
PIDENT_MODE	995	20	Main identification mode
PIDENT_SUB_MODE	1125	10	Sub-identification mode
CMD_PIDENT	997	ncStart (= 260)	Command

 After setting CMD_PIDENT to ncStart, the parameters for the inverter losses are determined and can be read out as follows:

Parameter ID	ParID	Range of values	Units	Description
Name				
PIDENT_FIT*)	998	0.0 100.0	%	Quality of the iden-
				tification procedure
PIDENT_INVCL_A1**)	992	0.0 40.0		Inverter: Gain fac-
				tor
PIDENT_INVCL_A2***)	993	0.0FLT_MAX	1/A	Inverter: Exponent

*) The quality of identification is assessed as follows:

 $80\% < PIDENT_FIT \le 100\% Good$

60% < PIDENT_FIT ≤ 80% Tolerable

0% < PIDENT_FIT ≤ 60% Unusable

0% Invalid

**) "SSO - Inverter adjustment amplification factor"

PIDENT_INVCL_A1 * 10³

"SSO - Inverter adjustment exponent" ≙ PIDENT_INVCL_A2 * 10³

Danger!

Determined parameters PIDENT_INVCL_A1 and PIDENT_INVCL_A2 depend on switching frequency F_SWITCH of the inverter! If the switching frequency is changed, the parameters must be determined again!

4.5.2.2.3 Configuration in SafeDESIGNER

- The SSO must be enabled in the encoder unit system ("EUS Encoder unit system") "EUS Encoder type"
 → Safe speed observer Rotatory/Linear
- The remaining encoder unit system must be configured (if not yet carried out).
- The determined motor and SSO parameters must be configured.
- Speed lag error monitoring must be enabled and tolerance "Encoder monitoring Speed error tolerance" configured.
- The settings for SSO must be tested with the standard application.
- Speed tolerance "SSO Speed tolerance safe speed" must be determined by measuring the deviation, see
 4.5.2.2.4 "Determining the tolerance Speed tolerance safe speed" on page 342.

Information:

The parameters determined in Automation Studio can have a different scaling than those that must be configured in SafeDESIGNER!

Example of a stator resistance read out in Automation Studio:[Ω] Stator resistance to be configured in SafeDESIGNER: [$m\Omega$]

Information:

The SafeMOTION Help Tool can be used to support the conversion of parameters into the correct system of units! The results must be verified!

4.5.2.2.4 Determining the tolerance - Speed tolerance safe speed

- To determine the optimal speed tolerance "SSO Speed tolerance safe speed", it must first be configured to a very high value (>50% of the nominal speed) in SafeDESIGNER.
- If a safety function should be activated that monitors the speed, the speed limit to be monitored must be set higher than the configured tolerance
 (1% n_{Rated} ≤ Tolerance safe speed ≤ LIM_{SOS} ≤ LIM_{SLS3} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ EUS Maximum speed to normalize speed range).
- A movement must be made with the motor and the following parameter IDs recorded via Trace:

	ParID name	Value	Description
Safely observed speed	SAFEMC_SPEED_ACT	6	(INT) SafeMC: Actual speed (sUnits/s)
Non-safe actual speed (speed controller)	SCTRL_SPEED_ACT	251	(REAL) CTRL Speed controller: Actual speed (1/s)
Non-safe actual speed (position controller)	PCTRL_V_ACT	92	(REAL) CTRL Position controller: Actual speed (units/s)

- Either "SCTRL_SPEED_ACT" or "PCTRL_V_ACT" can be recorded as unsafe actual speed.
- The recorded speeds must be rescaled to the same system of units for comparison.
- The necessary tolerance can be determined by comparing the two speeds.
 Note: When comparing using "Trace", a time offset of approximately 3.2 ms occurs and must be taken into account.
- In the stationary state, the deviation between "SAFEMC_SPEED_ACT" and "SCTRL_SPEED_ACT/PC-TRL_V_ACT" is typically less than in the dynamic state. Therefore, the tolerance in the dynamic case should be determined.
- The determined tolerance must be configured in SafeDESIGNER.
- · The speed limits used for the safety functions must be checked.

Danger!

The greater the speed tolerance "SSO - Speed tolerance safe speed" is configured, the greater the speed error that can occur!

Information:

The two recorded speeds "SAFEMC_SPEED_ACT" and "SCTRL_SPEED_ACT/PCTRL_V_ACT" are scaled differently.

Information:

When using "Trace" to compare the gray actual speed with the safely observed speed, a time offset of about 3.2 ms occurs.

4.5.3 Safety functions in combination with SSO

The following safety functions can be used in combination with the safe speed observer:

- STO
- SBC
- SS1
- SLS1 SLS4
- STO1
- SLT

4.6 Safe torque

Information:

This functionality is only available for ACOPOS P3 SafeMOTION!

4.6.1 Parameter

Parameter			Default value	Starting in Safety Re- lease
Motor - Number of pole pairs (hardware upgrade 1.10.2.x and later)	-	Number of pole pairs on the rotor circumference	1	1.10
Motor - Direction*) (hardware upgrade 1.10.2.x and later)	Standard / Inverse	Direction of rotation of the motor		1.10
Motor - Stator resistance (hardware upgrade 1.10.2.x and later)	mOhm	Ohmic stator resistance measured between two connections (phase - phase) of the motor		1.10
Motor - Stator inductance (hardware upgrade 1.10.2.x and later)	ator inductance µH Stator inductance measured between two connections (phase - 0		0	1.10
Motor - Torque constant (hardware upgrade 1.10.2.x and later)	μNm / A	Torque constant of the motor	0	1.10
Motor - Rated speed (hardware upgrade 1.10.2.x and later)	units/s	Nominal speed of the motor	0	1.10
Motor - Stall current (hardware upgrade 1.10.2.x and later)	mA	Stall current of the motor	0	1.10
Motor - Rated current (hardware upgrade 1.10.2.x and later)	mA	Nominal current of the motor	0	1.10
Motor - Peak current (hardware upgrade 1.10.2.x and later)	mA	Peak current of the motor	0	1.10
Motor - Stall torque (hardware upgrade 1.10.2.x and later)	mNm	Stall torque of the motor that is output when the stall current is applied	0	1.10
Motor - Peak torque (hardware upgrade 1.10.2.x and later)	mNm	Peak torque of the motor that is briefly output when the peak current is applied	0	1.10
Motor - Moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	Mass moment of inertia of the motor. Consists of the sum of the inertias of the rotor, encoder and holding brake.	0	1.10
Motor - External moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	External mass moment of inertia, depends on the total external load	0	1.10

Table 217: SafeMOTION parameter group: General settings - Motor

4.6.2 Behavior

Safe electric motor torque M (Safe Torque) is determined by the amount of the stator-proof current space vector $I_S(i_\alpha, i_\beta)$ and the configured motor torque characteristic curve.

The motor torque characteristic curve is approximated by a piecewise continuous linear function and specifies the relationship between motor torque and effective stator current I_s . The amount of stator-fixed current space vector I_s is greater by $\sqrt{2}$ according to effective stator current I_s .

$$T = \min \left(k_T \frac{i_S}{\sqrt{2}}; T_0 + \frac{T_P - T_0}{I_P - I_0} \left(\frac{i_S}{\sqrt{2}} - I_0 \right) \right)$$
where $I_S = \frac{i_S}{\sqrt{2}}$

- k_T Torque constant of the motor
- I₀ Stall current of the motor
- I_P Peak current of the motor
- T₀ Stall torque of the motor
- T_P Peak torque of the motor

Information:

The safe torque is based on the safe current measurement, therefore the notes and information of the safe current measurement are also valid for the safe torque. See Safe current measurement.

^{*)} The direction of rotation of the motor is not related to the counting direction of the speed ("EUS - Counting direction"), i.e. the direction of rotation of the motor can be changed explicitly in the non-safe application and must therefore also be taken into account in SafeDESIGNER.

Danger!

The safe torque specifies the maximum amount of electric motor torque. This must be taken into account when using the safe torque.

Danger!

Due to an error in the motor (commutation error, demagnetization, etc.), the amount of actual electric motor torque can be less than the determined safe torque.

This must be taken into account when using the safe torque.

Danger!

Overheating of the motor can change the torque constant k_T and therefore negatively influence the safe torque. Ensure that the motor has been sized so as to prevent overheating.

Danger!

The safe torque can only be used for synchronous motors with undefined poles $(L_d=L_o)!$

Danger!

If the accuracy of the current measurement is not taken into account when setting the value that should be configured, the monitored current value or torque could be too low under certain conditions. In this case, it cannot be guaranteed that the target torque will be reached or that the torque limit will be correctly monitored; the result of the safety function is therefore invalid!

Danger!

The accuracy of the safe current only applies up to the continuous current of the performance class used. It is not permitted to use a safety function that should monitor or detect a current above the continuous current of the performance class used.

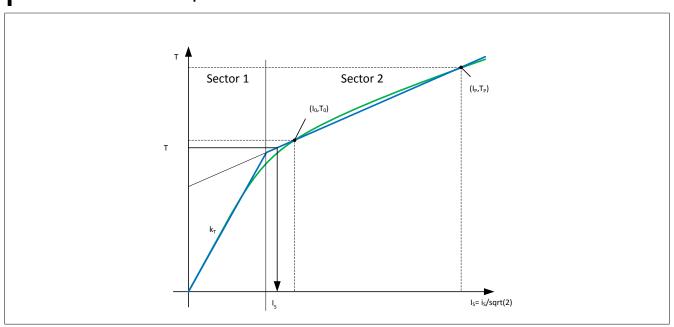

Figure 72: Configured motor torque characteristic curve

Danger!

The configuration parameters of the motor torque characteristic must be determined and configured according to the motor manufacturer's specifications, taking into account the unfavorable case to be assumed (rotor position-dependent fluctuations, manufacturing tolerances, linearization errors, etc.)!

SafeMOTION User's Manual V 4.6.1

4.7 Safe Torque Off (STO)

4.7.1 Parameters

None

4.7.2 Behavior

STO is the fundamental safety function of the SafeMOTION module since it represents the "idle current principle". A request from the STO safety function activates safe pulse disabling and switches off the torque and power to the drive. Activation of safe pulse disabling is performed actively by the SafeMOTION module.

Danger!

A STO request causes synchronized axes to no longer be synchronous.

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

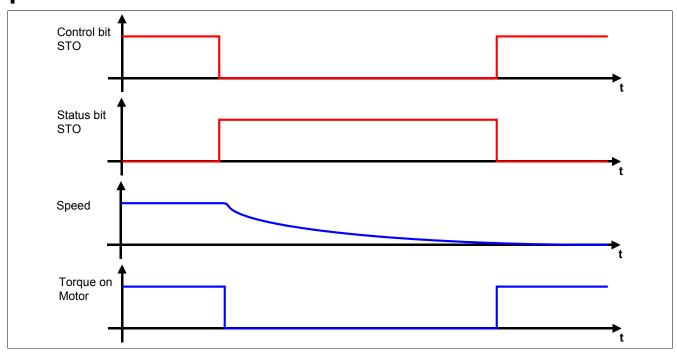

Figure 73: Safe Torque Off (STO)

Information:

The functional safe state of the STO safety function has been achieved when the pulse disabling outputs are switched to 0 V. The respective bit is set when the functional safe state has been achieved.

Danger!

If the drive is in motion at the time STO is requested, it will coast to a stop. The resulting residual movement and time depends on the properties of the machine and must always be considered when dimensioning the safety equipment.

The maximum possible (worst case) movement must be assumed.

The maximum possible speed is determined by the current operating mode. If there is no active safety function, the maximum speed that is physically possible for the motor must be assumed.

Danger!

If the SMS or SLS safety function is active, the assumed maximum speed can be reduced to the currently active configured speed limit plus the maximum possible acceleration during the error response time.

Information:

The resulting residual movement and time determines the clearances that must be observed for the safety features and therefore the overall size of the machine.

Information:

The STO safety function does not require safe encoder evaluation.

Danger!

If the STO safety function is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

4.8 Safe Torque Off, single-channel (STO1)

4.8.1 Parameters

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	High-side/	Selects the high-side or low-side IGBT in the STO1 function		High-side	R 1.3
(previously Channel selection for One Channel STO (STO1))	Low-side Value High-side	Value	Description		
		High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 218: SafeMOTION parameter group: Basic functions - STO1

4.8.2 Behavior

The STO1 safety function works in the same way as STO. The only difference is that either only the high-side or only the low-side IGBTs are switched off depending on the configuration. The two configuration options (High-side/Lowside) are equivalent with regard to safety technology.

Information:

The functional safe state of the STO1 safety function has been achieved when the configured pulse disabling output is switched to 0 V.

The respective bit is set when the functional safe state has been achieved.

Information:

The two-channel aspect is lost because either only the low-side or only the high-side of the pulse disabling is activated with the STO1 safety function.

This results in a lower SIL and performance level!

Information:

The STO1 safety function does not require safe encoder evaluation.

Danger!

If the safety function STO1 is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

If safe pulse disabling is only cut off on one side, then the short circuit braking integrated in the inverter unit can be used for deceleration.

Danger!

Short circuit braking in the inverter unit is not suitable for safety purposes and can therefore only be used to protect the machine. If the release of motor energy could result in dangerous situations (e.g. with hanging loads), then a mechanical safeguard must also be installed.

4.9 Safe Brake Control (SBC)

4.9.1 Parameters

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 219: SafeMOTION parameter group: Basic functions - SBC

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.9.2 Behavior

The SBC safety function is a safe (time-delayed) output that can be used to safely control a motor holding brake.

Information:

To achieve a defined SIL level, the controlled holding brake must also have at least the same SIL level and errors in the wiring must be ruled out.

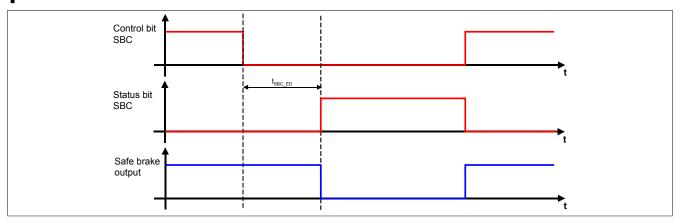

Figure 74: Safe Brake Control (SBC)

Only the actuation of the motor holding brake output by the SafeMOTION module is rated SIL 2.

The SafeMOTION module does not provide safe monitoring of the braking procedure.

Information:

The functional safe state of the SBC safety function has been achieved when the safe motor holding brake output has been switched to 0 V.

The respective bit is set when the functional safe state has been achieved.

The purpose of the delay time t_{SBC_ED} is to compensate for the different runtimes of the standard and safety applications.

Information:

The SBC safety function does not require safe encoder evaluation.

Danger!

If the SBC safety function is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

Information:

Functional errors will occur (e.g. 6029: Holding brake: Control signal on and output status off), if the holding is released by the standard application but the motor holding brake output is switched to 0 V by the SafeMOTION module.

4.10 Safe Operating Stop (SOS)

4.10.1 Parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

•	•	0 '' ,		,
Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance</i> (units))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 220: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

4.10.2 Behavior

An enabled SOS safety function monitors the drive to ensure that it stops safely. The SafeMOTION module does not control pulse disabling.

The drive can remain active and must be kept at standstill by the standard application.

Information:

The SOS safety function requires safe evaluation of the speed and position.

If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

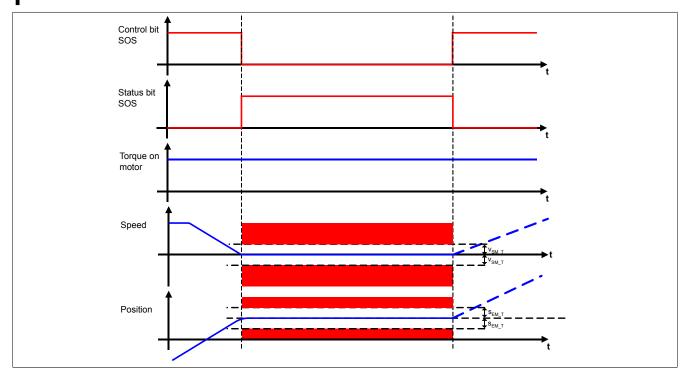

Figure 75: Safe Operating Stop (SOS)

SafeMOTION User's Manual V 4.6.1

To prevent the axis from drifting, both the speed and position are monitored with standstill tolerance limits. The position window is generated when the safety function is requested. If the request is withdrawn, then monitoring of the standstill tolerance window will also be terminated. The next time a request is made, the standstill tolerance position window is regenerated based on the current position.

Information:

The functional safe state of the SOS safety function has been achieved when the drive is stopped and the standstill is being safety-monitored.

The respective bit is set when the functional safe state has been achieved.

The standstill tolerances can be configured for each axis in SafeDESIGNER.

Danger!

In the event of an error, forward movement can occur during the error response time when monitoring the standstill tolerance window. During this time, the drive can accelerate to its maximum before coasting to a stop.

The speed and position limits being monitored must be set in a manner so that the calculated forward movement does not cause any danger.

The dangerous movement must be determined by a risk analysis.

If the stop monitoring limits are violated, safe pulse disabling is activated and the drive switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. An error will cause a synchronous axis to no longer be synchronous.

Danger!

If a standstill limit (position or speed) is violated, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. The "S_NotErrFUNC" output on the function block is reset.

Danger!

If the SOS safety function is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The configured limits must be violated with the function enabled and the error response must be tested accordingly!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

4.11 Safe Stop 1 (SS1)

4.11.1 Parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp monitoring - Enable de- lay time (previously <i>Delay time to start</i> ramp monitoring (us))	[h2]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 221: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descript	tion	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled	addition	ramp-based monitoring (in to time-based monitoring) s SS1 function is requested		R 1.3
		Value	Description		
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously <i>Ramp Monitoring Time for</i> <i>SS1</i> (us))	[µs]	Decelera SS1	ttion ramp monitoring time for	0	R 1.3

Table 222: SafeMOTION parameter group: Basic functions - SS1

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)		Deceleration ramp monitoring is terminated prematurely if the value falls below the lower limit "Early limit monitoring": If the current speed during the deceleration process falls below the end speed limit of the activated safety function for a defined amount of time, then the safe state of the respective function will be activated prematurely.			R 1.3
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Moni-	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3
toring time (us))		ond state			

Table 223: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

4.11.2 Behavior

When requesting the SS1 safety function, the deceleration process of the axis is monitored until standstill after the ramp delay time passes. After decelerating, safe pulse disabling is activated and switches off the torque/power to the drive.

Danger!

Synchronous axes will no longer be synchronous when SS1 is in a safe state.

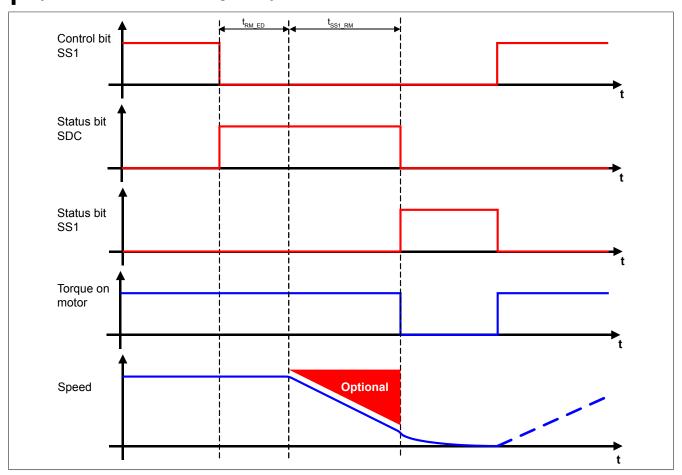

Figure 76: Safe Stop 1 (SS1)

The deceleration itself is controlled by the non-safety-related standard application.

The purpose of the ramp delay time parameter "Ramp monitoring - Enable delay time" (t_{RM_ED}) is to compensate for the different runtimes of standard and safety applications.

Information:

The functional safe state of the SS1 safety function has been achieved when the pulse disabling outputs are switched to 0 V. The respective bit is set when the functional safe state has been achieved.

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Depending on the requirements for the safety function and its parameter settings, it is possible to monitor either only the deceleration time $t_{SS1\ RM}$ or the deceleration ramp as well.

If the monitoring limits are violated during deceleration, then an acknowledgeable error state is entered.

The "SS1 - Ramp monitoring - Time" (t_{SS1_RM}) parameter configures the ramp monitoring behavior.

4.11.3 SS1 - Stopping procedure with ramp-based monitoring

"SS1 - Ramp monitoring - Enable" = Enabled

With this setting, the configurable deceleration ramp is monitored in addition to time-based monitoring. In the event of an error, this provides the advantage that a lower maximum speed can be assumed when entering the safe state. During deceleration ramp monitoring, the standard application must ensure that the stopping procedure for a hazardous situation is handled accordingly.

The slope of the monitoring ramp can be set using the "Ramp monitoring - Speed deceleration limit" $(a_{RM L})$ parameter.

A timer is started when the safety function is requested. After the "Ramp monitoring - Enable delay time" (t_{RM_ED}) has expired, monitoring of the deceleration ramp begins. The monitored ramp always begins at the currently monitored limit and is calculated using the configured slope. If the monitoring ramp reaches the configurable standstill speed limit "Standstill monitoring - Speed tolerance" (v_{SM_T}) or if the monitoring time "SS1 - Ramp monitoring - Time" ($t_{SS1~RM}$) has expired, then safe pulse disabling is activated and torque is switched off on the drive.

Setting "Early limit monitoring" to "Enable" makes it possible to configure an early enabling of the safe state. If the setting above has been made, then the safe state of the safety function will be started when the current speed falls below the standstill speed limit for at least the amount of time defined by "Early limit monitoring - Time" (t_{ELM}) during deceleration ramp monitoring.

If the active limit is violated during monitoring of the deceleration procedure, then the drive will immediately switch to the acknowledgeable Functional Fail Safe error state.

Information:

If ramp monitoring is configured for the safety function SS1, then the speed must be safely evaluated. If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

Danger!

If safe pulse disabling is activated (coast to stop) and the safety function is in its functional safe state, the maximum speed at the end of the deceleration ramp must be used to calculate the residual distance

To determine the maximum possible speed, it must be assumed that in the event of error, the drive will accelerate to its maximum during the error response time starting from the standstill speed limit. The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

If the monitored ramp is exceeded, the residual distance must be calculated based on the error response time, starting with the currently monitored speed limit.

The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

If the SS1 safety function with ramp-based monitoring is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should include at least one violation of the monitored ramp, and the error response must be tested accordingly!

4.11.4 SS1 - Stopping procedure with time-based monitoring

"SS1 - Ramp monitoring - Enable" = Disabled

This configuration provides true time-based monitoring of the deceleration.

A timer is started when the safety function is requested. Within this time frame, the drive must implement a stopping procedure via the standard application that is appropriate for the respective dangerous situation.

After the delay time of the request "Ramp monitoring - Enable delay time" (t_{RM_ED}) plus the monitoring time "SS1 - Ramp monitoring - Enable" have expired, safe pulse disabling is activated and the drive loses all torque.

Information:

With this configuration of the Safe Stop 1 safety function, only the time frame is monitored. No speed limit or position window is monitored.

The function can therefore also be used in this configuration without safe encoder evaluation!

Danger!

If safe pulse disabling is activated (coast to stop), the maximum speed after the time frame has expired must be used to calculate the residual distance!

The drive can move at its maximum physical speed during this time window (plus the response time of the safe pulse disabling). If SMS is active, then the speed limit plus the error tolerance can be assumed as the maximum speed.

The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

If the SS1 safety function with true time-monitoring is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The drive should be accelerated to its maximum during the monitored time frame and the error response tested accordingly!

4.12 Safe Stop 2 (SS2)

4.12.1 Parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp monitoring - Enable de- lay time (previously <i>Delay time to start</i> ramp monitoring (us))	[h2]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 224: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description	Description		Starting in Safety Release
SS2 - Ramp monitoring - Enable	Enabled/ Disabled		activates ramp monitoring (in addition to time-based monitoring) when the SS2 function is requested		R 1.3
		Value	Description		
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ra	amp monitoring time for SS2	0	R 1.3

Table 225: SafeMOTION parameter group: Speed functions - SS2

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	Deceleration ramp monitoring is terminated prematurely if the value falls below the lower limit "Early limit monitoring": If the current speed during the deceleration process falls below the end speed limit of the activated safety function for a defined amount of time, then the safe state of the respective function will be activated prematurely. Value Description			R 1.3
		Enabled Disabled	"Early Limit Monitoring" is active! "Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]		the speed must be below the target speed limit in order to the deceleration ramp and to assume the safety function's		R 1.3

Table 226: SafeMOTION parameter group: General settings - Early limit monitoring

SafeMOTION User's Manual V 4.6.1

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance (units</i>))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 227: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

4.12.2 Behavior

With SS2, the deceleration process is monitored until standstill after the ramp delay time passes. The drive must then be kept at standstill by the standard application. As with SOS, this standstill is monitored by the SafeMOTION module according to the configured standstill tolerance window "Standstill monitoring - Speed tolerance" (v_{SM_T}) and "Standstill monitoring - Position tolerance" (s_{SM_T}).

The delay itself must be generated by the non-safety-related, standard application by halting the drive in response to the dangerous situation.

Information:

The Safe Stop 2 safety function requires safe evaluation of the speed and position. If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

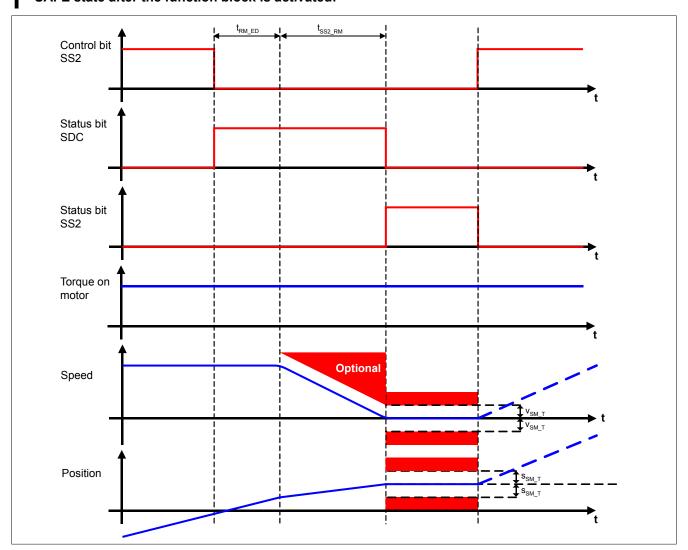

Figure 77: Safe Stop 2 (SS2)

Danger!

If a standstill limit (position or speed) is violated, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. Output "S_NotErrFUNC" or "S_Status_NotErrFunc" of the function block is reset!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

SafeMOTION User's Manual V 4.6.1

The purpose of the ramp delay time parameter "Ramp monitoring - Enable delay time" (t_{RM_ED}) is to compensate for the different runtimes of standard and safety applications.

Information:

The functional safe state of the SS2 function has been achieved when the drive is stopped and the standstill is being safety-monitored.

The respective bit is set when the functional safe state has been achieved.

As with SS1, it is possible to monitor either only the deceleration time or also the deceleration ramp depending on the requirements of the safety function.

The "SS2 - Ramp monitoring - Time" ($t_{SS2\ RM}$) parameter configures the ramp monitoring behavior.

4.12.3 SS2 - Stopping procedure with ramp-based monitoring

"SS2 - Ramp monitoring - Enable" = Enabled

With this setting, the configurable deceleration ramp is monitored in addition to time-based monitoring. In the event of an error, this provides the advantage that a lower maximum speed can be assumed when entering the safe state. During deceleration ramp monitoring, the standard application must ensure that the stopping procedure for a hazardous situation is handled accordingly.

The slope of the monitoring ramp can be set using the "Ramp monitoring - Speed deceleration limit" (a_{RM_L}) parameter.

A timer is started when the safety function is requested. After the "Ramp monitoring - Enable delay time" (t_{RM_ED}) has expired, monitoring of the deceleration ramp begins. The monitored ramp always begins at the currently monitored limit and is calculated using the configured slope. If the monitoring ramp reaches the configurable standstill speed limit "Standstill monitoring - Speed tolerance" (v_{SM_T}) or if the monitoring time "SS2 - Ramp monitoring - Time" (t_{SS2_RM}) has expired, then a position window is established and monitoring of the standstill tolerances is started.

Setting "Early limit monitoring" to "Enable" makes it possible to configure an early enabling of the safe state. If the setting above has been made, then the safe state of the safety function will be started when the current speed falls below the standstill speed limit for at least the amount of time defined by "Early limit monitoring - Time" (t_{ELM}) during deceleration ramp monitoring.

If the active limit or standstill window is violated during monitoring of the deceleration procedure or standstill, then the drive will immediately switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Danger!

When the monitored ramp or standstill tolerance window is exceeded, the residual distance must be calculated based on the error response time, starting with the currently monitored speed limit. The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

In the event of an error, forward movement can occur during the error response time when monitoring the standstill tolerance window. During this time, the drive can accelerate to its maximum before coasting to a stop.

The speed and position limits being monitored must be set in a manner so that the calculated forward movement does not cause any danger.

The dangerous movement must be determined by a risk analysis.

Danger!

If the SS2 safety function with ramp-based monitoring is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should contain at least one violation of the monitored ramp and standstill tolerance window. The error response must be tested accordingly!

4.12.4 SS2 - Stopping procedure with time-based monitoring

"SS2 - Ramp monitoring - Enable" = Disabled

This configuration provides true time-based monitoring of the deceleration.

A timer is started when the safety function is requested. Within this time frame, the drive must implement a stopping procedure via the standard application that is appropriate for the respective dangerous situation.

After the delay time of the request "Ramp monitoring - Enable delay time" (t_{RM_ED}) plus the monitoring time "SS2 - Ramp monitoring - Time" ($t_{SS2\ RM}$) have expired, the standstill tolerance window is safety-monitored.

Danger!

If the standstill tolerance window is exceeded, the residual distance must be calculated based on the error response time, starting with the currently monitored speed limit.

The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

In the event of an error, forward movement can occur during the error response time when monitoring the standstill tolerance window. During this time, the drive can accelerate to its maximum before coasting to a stop.

The speed and position limits being monitored must be set in a manner so that the calculated forward movement does not cause any danger.

The dangerous movement must be determined by a risk analysis.

Danger!

If the SS2 safety function with time-monitored stopping procedure is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it! The test should contain at least one violation of the standstill tolerance window. The error response must be tested accordingly!

4.13 Safely Limited Speed (SLS)

4.13.1 Parameters

SLS4 - Ramp monitoring - Time	[µs]	Deceleration ra	amp monitoring time for SLS4	0	R 1.3
(previously Ramp Monitoring Time for SLS4 (us))					

Table 230: SafeMOTION parameter group: Speed functions - SMS/SLS

Danger!

The respective monitored speed limit must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous speed cannot be exceeded in the event of error.

The dangerous speed must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $\mathsf{LIM}_{\mathsf{SOS}} \leq \mathsf{LIM}_{\mathsf{SLS4}} \leq \mathsf{LIM}_{\mathsf{SLS3}} \leq \mathsf{LIM}_{\mathsf{SLS2}} \leq \mathsf{LIM}_{\mathsf{SLS1}} \leq \mathsf{LIM}_{\mathsf{SMS}} \leq \mathsf{EUS} \text{ - Maximum speed to normalize speed range } \mathsf{LIM}_{\mathsf{SLS4}} \leq \mathsf{LIM}_{\mathsf{SLS4}}$

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

4.13.2 Behavior

The purpose of the SLS safety function is to monitor a specified speed limit: Parameters "SLS1 - Speed limit", "SLS2 - Speed limit", "SLS3 - Speed limit", "SLS4 - Speed limit" (v_{SLSX_L}). It is also possible to monitor deceleration until the limit is reached if needed by the application.

Four different speed limits can be monitored on the SafeMOTION module. All limits can also be monitored in parallel. If a request is made to monitor multiple speed limits at the same time, then the lowest limit value will always be monitored. To make this possible, the function block includes four different inputs "S_RequestSLSX" or "S_Control_SLS-X" [X = 1..4].

The standard (non-safety-related) application must implement a closed-loop control appropriate for the level of danger to decelerate the movement and ensure adherence to the respective speed limit.

Information:

The SLS safety function requires safe evaluation of the speed. If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

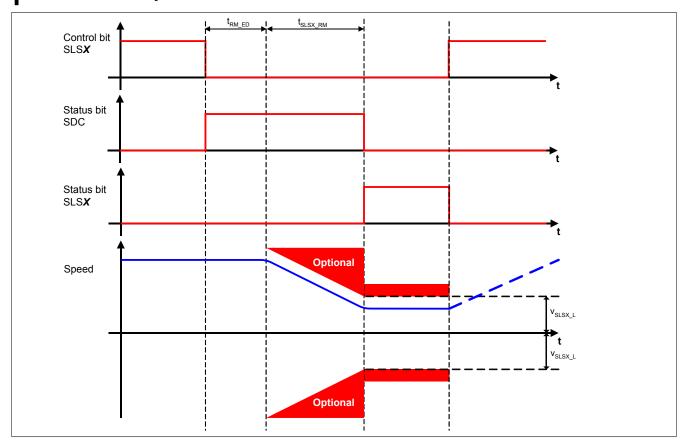

Figure 78: Safely Limited Speed (SLS)

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Danger!

If a speed limit is violated, then the SafeMOTION module switches to the acknowledgeable FUNCTION-AL FAIL SAFE error state.

Torque and power to the drive are switched off, causing the drive to spin out!

An error will cause a synchronous axis to no longer be synchronous! Output "S_NotErrFUNC" or "S_Status NotErrFunc" of the function block is reset!

The purpose of the ramp delay time t_{RM_ED} is to compensate for runtime differences between the standard and safety applications.

If the delay time ("SLS1 - Ramp monitoring - Time", "SLS2 - Ramp monitoring - Time", "SLS3 - Ramp monitoring - Time", "SLS4 - Ramp monitoring - Time" (t_{SLSX_RM})) is set to zero, then the speed limit will be monitored immediately after the request is made for the safety function.

Information:

The functional safe state of the SLS safety function has been achieved if the drive has not exceeded a defined speed limit and this limit is being safety-monitored. The respective bit is set when the functional safe state has been achieved.

Like with SS1 and SS2, the deceleration ramp monitoring can be adjusted according to the requirements, so that either only the deceleration time or both the deceleration time and the deceleration ramp are monitored. Parameter "SLS - Ramp monitoring - Enable" configures the ramp monitoring behavior.

4.13.3 SLS - Stopping procedure with ramp-based monitoring

"SLS - Ramp monitoring - Enable" = Enabled

With this setting, the configurable deceleration ramp is monitored in addition to time-based monitoring. In the event of an error, this provides the advantage that a lower maximum speed can be assumed when entering the safe state. During deceleration ramp monitoring, a deceleration procedure must be adjusted to the dangerous situation by the standard application.

The slope of the monitoring ramp can be set using the "Ramp monitoring - Speed deceleration limit" (a_{RM_L}) parameter.

A timer is started when the safety function is requested. After the "Ramp monitoring - Enable delay time" (t_{RM_ED}) has expired, monitoring of the deceleration ramp begins. The monitored ramp always begins at the currently monitored limit and is calculated using the configured slope.

If the monitored ramp reaches the corresponding speed limit ("SLS1 - Speed limit", "SLS2 - Speed limit", "SLS3 - Speed limit", "SLS4 - Speed limit" (v_{SLSX_L})) or the monitoring time ("SLS1 - Ramp monitoring - Time", "SLS2 - Ramp monitoring - Time", "SLS3 - Ramp monitoring - Time", "SLS3 - Ramp monitoring - Time", "SLS4 - Ramp monitoring - Time" ($t_{SLSX_{RM}}$)) has expired, then the status of the safety function is set and the selected speed limit is monitored.

Setting "Early limit monitoring" to "Enable" makes it possible to configure an early enabling of the safe state. If the setting above has been made, then the safe state of the safety function will be started when the current speed falls below the monitored speed limit for at least the amount of time defined by "Early limit monitoring - Time" (t_{ELM}) during deceleration ramp monitoring.

Danger!

When the monitored ramp or the enabled safe speed is exceeded, the residual distance must be calculated based on the error response time, starting with the currently monitored speed limit. The spinout movement or residual distance is not permitted to result in a hazard!

Danger!

In the event of an error when monitoring the safe reduced speed, a dynamic forward movement that goes beyond the monitored limit can occur during the error response time.

During this time, the drive can accelerate to its maximum before coasting to a stop.

The speed limit being monitored must be set in a manner so that the calculated forward movement will not cause any danger. The dangerous movement must be determined by a risk analysis.

Danger!

If the safety function SLS with ramp-based monitoring is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should contain at least one violation of the monitored ramp and of each speed limit being used. The error response must be tested accordingly!

4.13.4 SLS - Stopping procedure with time-based monitoring

"SLS - Ramp monitoring - Enable" = Disabled

This configuration provides true time-based monitoring of the deceleration.

A timer is started when the safety function is requested. Within this time frame, the drive must implement a stopping procedure via the standard application that is appropriate for the respective dangerous situation. After the delay time of the request "Ramp monitoring - Speed deceleration limit" plus the monitoring time "SLS1 - Ramp monitoring - Time", "SLS2 - Ramp monitoring - Time", "SLS3 - Ramp monitoring - Time", "SLS4 - Ramp monitoring - Time" (t_{SLSX RM}) have expired, the speed limit is safety-monitored.

Danger!

When the speed limit is exceeded, the residual distance must be calculated based on the error response time, starting with the currently monitored speed limit.

The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

In the event of an error when monitoring the safe reduced speed, a dynamic forward movement that goes beyond the monitored limit can occur during the error response time.

During this time, the drive can accelerate to its maximum before coasting to a stop.

The speed limit being monitored must be set in a manner so that the calculated forward movement will not cause any danger.

The dangerous movement must be determined by a risk analysis.

Danger!

If the safety function SLS without ramp-based monitoring is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should contain at least one violation of each speed limit being used.

The error response must be tested accordingly!

4.14 Safe Maximum Speed (SMS)

4.14.1 Parameters

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter Parameter	Unit	Description I		Default value	Starting in Safety Release
SMS - Enable	Enabled/	Activates the SMS	S safety function by configuration	Enabled	R 1.3
	Disabled	Value	Description		
(previously Safe Maximum		Enabled	SMS activated		
Speed)		Disabled	SMS deactivated		
SMS - Speed limit	[units/s]		maximum speed (SMS)	0	R 1.3
(previously Maximum Speed for SMS (units/s))					
SLS1 - Speed limit	[units/s]	Speed limit 1 for S	SLS (SLS1)	0	R 1.3
(previously Safe Speedlimit 1 for SLS (units/s))					
SLS2 - Speed limit	[units/s]	Speed limit 2 for S	SLS (SLS2)	0	R 1.3
(previously Safe Speedlimit 2 for SLS (units/s))					
SLS3 - Speed limit	[units/s]	Speed limit 3 for 5	SLS (SLS3)	0	R 1.3
(previously Safe Speedlimit 3 for SLS (units/s))					
SLS4 - Speed limit	[units/s]	Speed limit 4 for S	SLS (SLS4)	0	R 1.3
(previously Safe Speedlimit 4 for SLS (units/s))					
SLS - Ramp monitoring - Enable	Enabled/ Disabled	Activates ramp-bathe SLS function	ased monitoring (in addition to time-based monitoring) when is requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)		Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS1 - Ramp monitoring - Time	[µs]	Deceleration ram	p monitoring time for SLS1	0	R 1.3
(previously Ramp Monitoring Time for SLS1 (us))					
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ram	p monitoring time for SLS2	0	R 1.3
(previously Ramp Monitoring Time for SLS2 (us))					
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ram	p monitoring time for SLS3	0	R 1.3
(previously Ramp Monitoring Time for SLS3 (us))					
SLS4 - Ramp monitoring - Time	[µs]	Deceleration ram	p monitoring time for SLS4	0	R 1.3
(previously Ramp Monitoring Time for SLS4 (us))					

Table 231: SafeMOTION parameter group: Speed functions - SMS/SLS

Danger!

The respective monitored speed limit must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous speed cannot be exceeded in the event of error.

The dangerous speed must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS4} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} \le EUS$ - Maximum speed to normalize speed range

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

4.14.2 Behavior

The difference between SMS and SLS is that SMS cannot be actively requested. It is either enabled (parameter "SMS - Enable" = Enabled) or disabled (parameter "SMS - Enable" = Disabled) in the configuration.

When enabled, the current speed is constantly monitored according to a defined limit ("SMS - Speed limit" (v_{SMS_L}) parameter).

Information:

The SMS safety function requires safe evaluation of the speed.

If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

Danger!

When the monitored speed limit is exceeded, the residual distance must be calculated based on the error response time.

The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

In the event of an error when monitoring the safe maximum speed, a dynamic forward movement that goes beyond the monitored limit can occur during the error response time.

During this time, the drive can accelerate to its maximum before coasting to a stop. The speed limit being monitored must be set in a manner so that the calculated forward movement will not cause any danger.

The dangerous movement must be determined by a risk analysis.

Danger!

If the SMS safety function is used in the safety application, then it must be tested when commissioning the machine!

The configured limit must be exceeded! The error response must be tested accordingly!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

4.15 Safely Limited Increment (SLI)

4.15.1 Parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

•	•	0 '' ,		,
Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance</i> (units))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 232: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SLI (previously Safely Limited Increment)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLI - Position limit (previously Safe Increments (units))	[units]	Maximum movable increments when SLI is active	0	R 1.3
SLI - Disable delay time (previously <i>SLI Off Delay (μs)</i>)	[µs]	Switch off delay of SLI	0	R 1.3

Table 233: SafeMOTION parameter group: Advanced functions - SLI

Danger!

The maximum increment range must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

4.15.2 Behavior

With the SLI safety function, the movement is monitored for a defined number of increments ("SLI - Position limit" (s_{SLI L}) parameter).

Information:

The SLI safety function requires safe evaluation of the speed and position.

If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

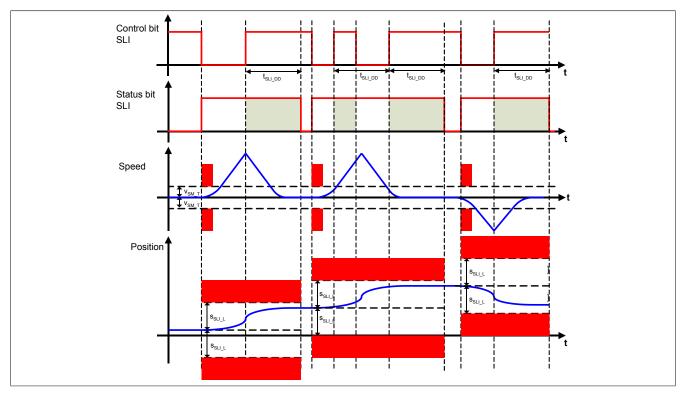

Figure 79: Safely Limited Increment (SLI)

Information:

The SLI safety function is only effective when used in combination with at least a second safety function. The SOS, SS2, or SLS safety functions are possible, for example.

Information:

The functional safe state of the SLI safety function has been achieved if the drive has not exceeded a defined increment size and this limit is being safety-monitored.

The respective bit is set when the functional safe state has been achieved.

The safe axis must be at a standstill when this function is enabled. To do this, the speed is monitored for adhering to the speed standstill tolerance (parameter "Standstill monitoring - Speed tolerance" ($v_{SM T}$).

A position window is then generated that is safety-monitored. This position window depends on the configured safe increment size ("SLI - Position limit" (s_{SLI_L} parameter). The standard application must guarantee that this position window is not exceeded.

After the safety function is disabled, monitoring continues for the configured period of time ("SLI - Disable delay time"(t_{SLI DD}) parameter). This prevents continuous movement caused by constant jogging.

Danger!

If a speed limit for requesting the function or the position window is violated, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous.

Output "S_NotErrFUNC" or "S_Status_NotErrFunc" of the function block is reset!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Danger!

In the event of an error when monitoring the safe increments, a dynamic forward movement that goes beyond the monitored limit can occur during the error response time.

During this time, the drive can accelerate to its maximum before coasting to a stop.

The resulting residual distance must be taken into account when configuring the permissible increments and is not permitted to present any danger.

The dangerous movement must be determined by a risk analysis.

Danger!

If the SLI safety function is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should contain at least one violation of the standstill speed limit when enabled and the permissible increments. The error response must be tested accordingly!

4.16 Safe Direction (SDI)

4.16.1 Parameters

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance</i> (units))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 234: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 235: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.16.2 Behavior

The SDI safety function monitors the defined direction of movement.

Either the positive or the negative direction can be monitored. The two inputs "S_RequestSDIpos" or "S_Control_SDI-P" and "S_RequestSDIneg" or "S_Control_SDI-N" are available on the function block for this purpose.

Information:

The SDI safety function requires safe evaluation of the position.

If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMC module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

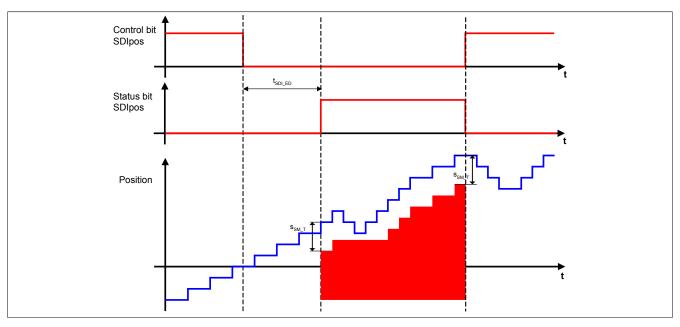

Figure 80: Safe Direction (SDI) - Positive direction of rotation allowed

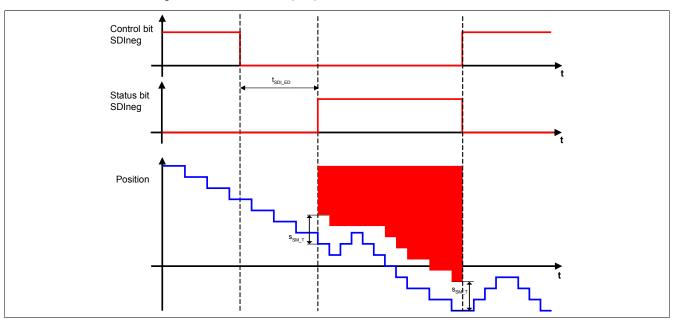

Figure 81: Safe Direction (SDI) - Negative direction of rotation allowed

Information:

The Safe Direction safety function can be activated in parallel with other safety functions. For example, SLS or SLI can be limited to a certain direction.

Information:

The functional safe state of the SDI safety function has been achieved if the drive has not violated a defined direction of movement and this direction of movement is being safety-monitored. The respective bit is set when the functional safe state has been achieved.

The purpose of the delay time "SDI - Enable delay time" (t_{SDI_ED}) is to compensate for the different runtimes of standard and safety applications.

When monitoring the direction of movement, then standstill tolerance ("Standstill monitoring - Position tolerance" (s_{SM_T}) parameter) is not permitted to be exceeded in the forbidden direction of movement. When moving in the permissible direction of movement, the position window moves along with it.

Danger!

If the safe direction of movement is violated, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. Torque and power to the drive are switched off, causing the drive to spin out!

An error will cause a synchronous axis to no longer be synchronous!

Output "S_NotErrFUNC" or "S_Status_NotErrFunc" of the function block is reset!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Danger!

In the event of an error when monitoring the safe direction of rotation, a dynamic forward movement in the dangerous direction can occur during the error response time.

During this time, the drive can accelerate to its maximum before coasting to a stop. The resulting residual distance must be taken into account when configuring the permissible tolerance limits and is not permitted to present any danger.

The dangerous movement must be determined by a risk analysis.

Danger!

If the SDI safety function is used in the safety application, then each of the directions of movement that are being used must be tested by selecting and deselecting it when commissioning the machine! The test should contain at least one violation of each safe direction of movement that is being used. The error response must be tested accordingly!

4.17 Safely Limited Acceleration (SLA)

Information:

Safety function Safely Limited Acceleration (SLA) is only available with SafeMOTION Safety Release 1.9 (firmware 300) and later!

4.17.1 Parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance (units</i>))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 236: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Speed functions - SLA (previously Safely Limited Acceleration)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLA - Acceleration limit in pos- itive direction (previously Safe acceleration	[units/s ²]	Limit value for acceleration in the positive direction of movement	0	R 1.9
limit for SLA (units/s²) in positive direction)				
SLA - Deceleration limit in positive direction	[units/s²]	Limit value for deceleration in the positive direction of movement	0	R 1.9
(previously Safe deceleration limit for SLA (units/s²) in positive direction)				
SLA - Acceleration limit in negative direction	[units/s ²]	Limit value for acceleration in the negative direction of movement	0	R 1.9
(previously Safe acceleration limit for SLA (units/s²) in negative direction)				
SLA - Deceleration limit in negative direction	[units/s²]	Limit value for deceleration in the negative direction of movement	0	R 1.9
(previously Safe deceleration limit for SLA (units/s²) in negative direction)				
SLA - Enable delay time	[µs]	Delay time between the SLA request and activation of the safety function	0	R 1.9
(previously Delay time to start SLA (us))				

Table 237: SafeMOTION parameter group: Speed functions - SLA

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.17.2 Behavior

The SLA safety function is used to monitor the acceleration or deceleration with respect to defined maximum limits.

Information:

The SLA safety function requires safe encoder evaluation.

If the safety function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

The parameters "SLA - Acceleration limit in positive direction" ($a_{SLA_ACC_P_L}$) and "SLA - Deceleration limit in positive direction" ($a_{SLA_DEC_P_L}$) can be used to set the limit values for acceleration and deceleration in the positive direction of movement. The parameters "SLA - Acceleration limit in negative direction" ($a_{SLA_ACC_N_L}$) and "SLA - Deceleration limit in negative direction" ($a_{SLA_ACC_N_L}$) can be used to set the limit values in the negative direction of movement.

Setting input "S_RequestSLA" or "S_Control_SLA" to SAFEFALSE requests safety function SLA.

After the "SLA - Enable delay time" (t_{SLA_ED}) has expired, the configured acceleration and deceleration limits are monitored. The purpose of the delay time is to compensate for the different runtimes of the standard and safety applications.

The "SafetyActiveSLA" or "S_Status_SLA" status bit will be set to SAFETRUE if no errors occur while monitoring is active.

Information:

The SLA safety function can be activated in parallel with other safety functions. This makes it possible, for example, to reduce the expected residual distances in the worst-case calculation.

Information:

The SLA safety function has achieved its safe state when the safety function is selected and no violation is detected during monitoring of the acceleration and deceleration limits.

The respective bit is set when the functional safe state has been achieved.

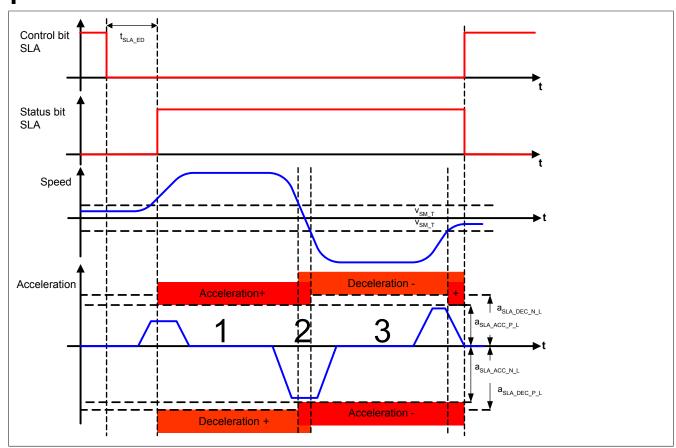

Figure 82: Safely Limited Acceleration (SLA)

Monitoring of acceleration and deceleration limits can be classified into the following 3 types (see Fig. 82 "Safely Limited Acceleration (SLA)"):

1 Positive direction of movement

If a movement in the positive direction is detected (current speed is greater than the value of the "Standstill monitoring - Speed tolerance" (v_{SM_T}) parameter for standstill monitoring), then the limit values set using the "SLA - Acceleration limit in positive direction" ($a_{SLA_ACC_P_L}$) and "SLA - Deceleration limit in positive direction" ($a_{SLA_DEC_P_L}$) parameters are monitored.

2 Standstill

If standstill is detected (current speed is within \pm the value set for the "Standstill monitoring - Speed tolerance" (v_{SM_T}) parameter for standstill monitoring), then the lowest limit value is used for monitoring in each case:

- "SLA Acceleration limit in positive direction" (a_{SLA_ACC_P_L}) and "SLA Deceleration limit in negative direction" (a_{SLA_DEC_N_L})
- "SLA Deceleration limit in positive direction" (a_{SLA_DEC_P_L}) and "SLA Acceleration limit in negative direction" (a_{SLA_ACC_N_L})

3 Negative direction of movement

If a movement in the negative direction is detected (current speed is less than the value of the "Standstill monitoring - Speed tolerance" (v_{SM_T}) parameter for standstill monitoring in the negative direction), then the limit values set using the "SLA - Acceleration limit in negative direction" $(a_{SLA_ACC_N_L})$ and "SLA - Deceleration limit in negative direction" $(a_{SLA_DEC_N_L})$ parameters are monitored.

Danger!

If an acceleration or deceleration limit is violated, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power and coasts to a stop!

In the event of an error, a synchronous axis will no longer be synchronous. The S_NotErrFUNC output on the function block is reset.

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Danger!

When calculating the residual distance when the monitored limit values are violated, the worst case scenario – i.e. the maximum speed possible – must be assumed. The maximum possible speed of the drive in the event of an error is calculated based on the speed at the time of the error, the maximum acceleration and the error response time.

The spin-out movement or residual distance is not permitted to result in a hazard!

Danger!

When acceleration or deceleration is safety-monitored, a dynamic forward movement may occur during the error response time. During this time, the drive can accelerate to its maximum before coasting to a stop. The limit being monitored must be set so that the calculated forward movement will not cause any danger.

The dangerous movement must be determined by a risk analysis.

Danger!

If the safety function is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should contain at least one violation of each configured limit. The error response must be tested accordingly!

4.18 Safe Homing

Information:

The Safe Homing safety function is only available with Safety Release R 1.4 and later!

4.18.1 Parameters

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Mode (previously <i>Mode</i>)	Direct / Reference switch / Home Offset / Home offset with correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Direct	R 1.4
Homing - Home position or home offset (previously <i>Home Position or</i>	[units]	Home position or home offset	0	R 1.4
Home Offset (units)) Homing - Enable RSP (Remanent safe position) (previously Remanent safe position)	Enabled/ Disabled	Selects whether or not to use the remanent safe position This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.9
Homing - Edge of reference switch (previously Edge of reference switch)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference system))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders. This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	0	R 1.4
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
Homing - Monitoring time (previously <i>Homing Monitoring Time</i> (µs))	[µs]	Monitoring time for the homing procedure	0	R 1.4

Table 238: SafeMOTION parameter group: Absolute position functions - Homing

4.18.2 Behavior

The Safe Homing function provides a way to establish a reference between the encoder position and the machine position.

Depending on the homing mode, it may be necessary for the drive to perform a homing procedure. A homing procedure requires the control functions between the electronic controller and the drive motor to be active. Other safety functions might have to be selected in order to prevent a hazardous state during the homing procedure.

The following homing modes are supported:

- Direct
- · Reference switch
- Home offset / Home offset with correction (only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!)

Information:

Safe homing requires safe evaluation of the position.

If the function is programmed in the safety application and if an error is detected in the safe encoder evaluation, then the SafeMOTION module immediately switches to the FAIL SAFE state after the function block is activated! The only way to exit the FAIL SAFE state is to complete a power off/on cycle!

A positive edge on the **RequestHoming** control bit starts "Safe Homing" and simultaneously resets the **SafePositionValid** status bit.

As soon as the homing procedure is finished, the **SafePositionValid** status bit is set and the **RequestHoming** control bit must be reset.

The homing procedure must be complete within the monitoring time "Homing - Monitoring time" (t_{HOME_M}) or else the SafeMOTION module will switch to the FUNCTIONAL FAIL SAFE state.

The homing procedure will be aborted if the **RequestHoming** control bit is reset before the procedure is completed.

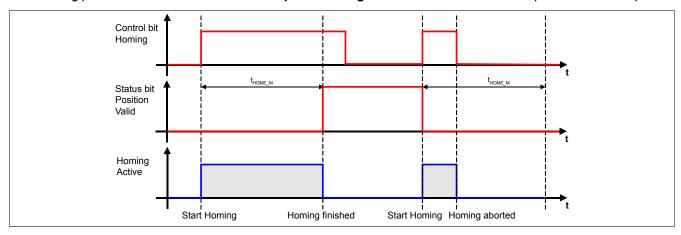

Figure 83: Safe Homing

Information:

The Safe Homing safety function is a prerequisite for implementing the SLP and SMP safety functions and for using the safe position. The SafePositionValid status will remain set to SAFEFALSE until safe homing has been performed!

Danger!

If an error occurs during the homing procedure, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The S_NotErrFUNC output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

In the event of an error, a synchronous axis will no longer be synchronous.

Danger!

If the safe position is used in SafeDESIGNER, then the "Position Valid" output of the SF_SafeMC_Position_BR(_V2, _V3) function block must also always be evaluated.

This will be reset immediately only with referenced axes SAFETRUE, and the first time an encoder error occurs (SAFEFALSE).

This enables the safety application to detect any encoder error, even if only brief.

If a machine reference is not required for the application, then the axis can be referenced using "Direct" mode.

4.18.2.1 ReqHominOK status

The S_ReqHominOK" or "S_Status_ReqHomingOk" status is only available with Safety Release R1.9 and later. The "S_ReqHominOK" or "S_Status_ReqHomingOk" status provides feedback in SafeDESIGNER regarding whether direct homing is performed when the "S_PositionValid" or "S_Status_Homing" status is already set, even for large cycle times.

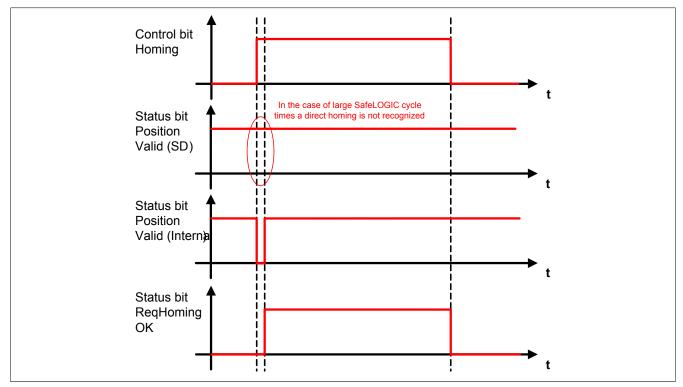

Figure 84: Safe homing - "ReqHomingOK" status bit

4.18.3 "Direct" mode

4.18.3.1 Parameters

Group: Absolute position functions - Homing (previously *Homing***)**

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Home position or home offset (previously Home Position or Home Offset (units))	[units]	Home position or home offset	0	R 1.4
Homing - Mode (previously <i>Mode</i>)	Direct / Reference Switch / Home Offset / Home Offset with Correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Direct	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!	Disabled	R 1.4

Table 239: SafeMOTION parameter group: Absolute position functions - Homing

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance</i> (units))		Position tolerance for standstill and direction monitoring	0	R 1.3

Table 240: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SMP - Enable	Enabled/	Activates the SMF	Activates the SMP safety function from the configuration		R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit	[units]	Lower position lim	it for the machine's full travel range	0	R 1.4
(previously Safe Lower Position Limit for SMP (units))					
SMP - Upper position limit	[units]	Upper position lim	it for the machine's full travel range	0	R 1.4
(previously Safe Upper Position Limit for SMP (units))					
SLP - Lower position limit	[units]	Lower position lim	it for the monitoring range	0	R 1.4
(previously Safe Lower Position Limit for SLP (units))					
SLP - Upper position limit	[units]	Upper position lim	it for the monitoring range	0	R 1.4
(previously Safe Upper Position Limit for SLP (units))					
SLP - Enable delay time	[µs]	Delay time between	en the SLP request and start of monitoring	0	R 1.4
(previously Delay time to start SLP (us))					

Table 241: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.18.3.2 Behavior

"Direct" mode is used if the current position of the axis is known and only needs to be applied to the SafeMOTION module

The following scenario is an example of how this mode can be used:

- A functional homing procedure is first carried out on the SafeMOTION module.
- The axis is then moved to a defined position.
- The operator confirms via a safe button that the position is correct → internally, a safe homing procedure
 is initiated in "Direct" mode.

When homing in "Direct" mode, the actual position of the axis is set to the value specified in the "Homing - Home position or home offset" (s_{HOME}) parameter immediately after the homing command (positive edge on the "S_RequestHoming" or "S_Control_Homing" input).

The "S_ReferenceSwitch" or "S_Control_RefSwitch" input is not evaluated.

Information:

The axis must be at a standstill when the homing request is made.

The values configured under "General settings - Standstill monitoring" are monitored in this regard. If the standstill tolerances are violated, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The "S_NotErrFUNC" or "S_Status_NotErrFunc" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

Information:

The reference pulse is not permitted to be used in Direct mode!

If the reference pulse is being used ("Homing - Enable reference pulse" = Enabled), then the system will enter state FAIL SAFE when checking the configuration during startup.

The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Information:

If Safe Maximum Position has been activated in the configuration ("SMP - Enable" = Enabled), then the value set for the "Homing - Home position or home offset" (s_{HOME}) parameter must lie within the permissible SMP window ("SMP - Lower position limit" ($s_{\text{SMP_LL}}$) and "SMP - Upper position limit" ($s_{\text{SMP_UL}}$) parameters).

If this is not the case, then the system will switch to the FAIL SAFE state when the configuration is checked during startup.

The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

4.18.4 "Reference switch" mode

4.18.4.1 parameter

Group: Absolute position functions - Homing (previously Homing)

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Mode (previously <i>Mode</i>)	Direct / Reference switch / Home Offset / Home offset with correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Direct	R 1.4
Homing - Home position or home offset (previously Home Position or Home Offset (units))	[units]	Home position or home offset	0	R 1.4
Homing - Enable RSP (Rema- nent safe position) (previously Remanent safe po- sition)	Enabled/ Disabled	Selects whether or not to use the remanent safe position This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.9
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference sys- tem))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders. This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		R 1.4
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
Homing - Monitoring time (previously <i>Homing Monitoring Time</i> (μs))	[µs]	Monitoring time for the homing procedure	0	R 1.4

Table 242: SafeMOTION parameter group: Absolute position functions - Homing

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 243: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

4.18.4.2 Behavior

"Reference switch" mode correlates with the "Switch Gate", "Abs Switch" and "Limit Switch" homing modes on the SafeMOTION module.

Information:

If the reference switch input ("S_ReferenceSwitch" or "S_Control_RefSwitch") on the function block is not connected, the SafeMOTION module will switch to the FAIL SAFE state.

The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Depending on the configuration, the SafeMOTION module will pass over the reference switch / limit switch several times.

Danger!

The reference switch / limit switch is part of the safety function and must therefore be accounted for in the risk analysis.

Use a debounced position switch suitable for safety applications!

The machine manufacturer is responsible for implementing a suitable switch!

After the homing command (i.e. positive edge of the "S_RequestHoming" or "S_Control_Homing" input), the SafeMOTION module uses the reference switch edge that matches the "Homing - Edge of reference switch" and "Homing - Trigger direction" as long as it is passed below the "Homing - Maximum trigger speed" (v_{HOME_MAX}) . If the reference switch is passed with a speed greater than the "Homing - Maximum trigger speed" (v_{HOME_MAX}) , then the reference switch edge is ignored.

Configuration	Reference switch evaluation
Homing - Edge of reference switch = Negative Homing - Trigger direction = Negative	- +
Homing - Edge of reference switch = Positive Homing - Trigger direction = Negative	- +
Homing - Edge of reference switch = Negative Homing - Trigger direction = Positive	- +
Homing - Edge of reference switch = Positive Homing - Trigger direction = Positive	- +

Table 244: Selecting the reference switch edge

Information:

After the homing command is given, the homing procedure must be completed within the configured "Homing - Monitoring time" (t_{HOME_M}). Otherwise, the SafeMOTION module will switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The function block output "S_NotErrFUNC" or "S_Status_NotErrFunc" is reset and the torque and power to the drive are switched off, causing it to spin out!

An error will cause a synchronous axis to no longer be synchronous.

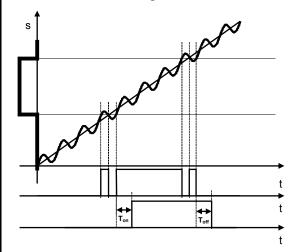

Danger!

The standstill "Standstill monitoring - Position tolerance" (s_{SM_T}) must be less than or equal to half the pulse width of the reference switch being used!

Danger!

The necessary filter (T_{on}, T_{off}) when reading the reference switch edges in SafeDESIGNER must be determined according to the control behavior during standstill.

Errors in the referenced absolute position due to the delay caused by the filter times must be taken into account!

4.18.4.2.1 ACOPOSmulti SafeMOTION SinCos

The home position is applied immediately after the reference switch edge is evaluated successfully.

4.18.4.2.2 ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION, ACOPOSmotor SafeMOTION

Homing - Enable reference pulse = Disabled

If the reference pulse is disabled, then the home position is applied immediately after the reference switch edge is evaluated successfully.

Homing - Enable reference pulse = Enabled

This mode is recommended when the positions of the ACOPOSmulti system and the SafeMOTION module must match exactly. Evaluation of the reference pulse compensates for the speed-dependent position difference by processing the two values at different times.

Information:

If "Homing - Enable reference pulse" is set to "Enabled", then a rotary EnDat 2.2 functional safety encoder must be used. The reference pulse is generated at each single-turn overflow.

If "Homing - Enable reference pulse" = Enabled, then the home position is not applied until the first valid reference pulse after the reference switch edge is reached.

After a valid reference switch edge is evaluated, the evaluation of the reference pulse is suppressed for the distance set by parameter "Homing - Blocking distance". The next reference pulse is only evaluated after this distance has been exceeded, at which point the home position is applied.

For a homing procedure to be valid, the direction of movement must not change between the time the reference switch edge occurs and the valid reference pulse; the "Homing - Maximum trigger speed" (v_{HOME_MAX}) limit must also not be exceeded.

Information:

If the direction of movement changes while searching for the reference pulse, the reference switch must be passed again.

Information:

If the "Homing - Maximum trigger speed" (v_{HOME_MAX}) speed limit is exceeded while searching for the reference pulse, the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The "S_NotErrFUNC" or "S_Status_NotErrFunc" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

In the event of an error, a synchronous axis will no longer be synchronous.

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

4.18.5 Mode Home offset / Home offset with correction (only available for SafeMOTION EnDat 2.2)

Information:

Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!

4.18.5.1 Parameters

Group: Absolute position functions - Homing (previously Homing)

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Home position or home offset	[units]	Home position or home offset	0	R 1.4
(previously Home Position or Home Offset (units))				
Homing - Mode	Direct / Reference Switch /	Selects the homing mode	Direct	R 1.4
(previously Mode)	Home Offset / Home Offset with Cor- rection	Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		

Table 245: SafeMOTION parameter group: Absolute position functions - Homing

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Description		Starting in Safety Release
SMP - Enable	Enabled/	abled/ Activates the SMP safety function from the configuration		Disabled	R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit (previously Safe Lower Posi-	[units]	Lower position li	mit for the machine's full travel range	0	R 1.4
tion Limit for SMP (units))					
SMP - Upper position limit (previously Safe Upper Position Limit for SMP (units))	[units]	Upper position lii	mit for the machine's full travel range	0	R 1.4
SLP - Lower position limit (previously Safe Lower Position Limit for SLP (units))	[units]	Lower position li	mit for the monitoring range	0	R 1.4
SLP - Upper position limit (previously Safe Upper Position Limit for SLP (units))	[units]	Upper position li	mit for the monitoring range	0	R 1.4
SLP - Enable delay time (previously <i>Delay time to start</i> SLP (us))	[µs]	Delay time between	een the SLP request and start of monitoring	0	R 1.4

Table 246: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.18.5.2 Behavior

If an absolute encoder is being used, then the machine reference can be established via an offset to the encoder position.

A homing procedure is not necessary.

The "Home offset" or "S_Control_RefSwitch" mode uses this offset directly, while "Home offset with correction" takes into account any encoder overflow that might occur in the permissible travel range.

The offset is configured in SafeDESIGNER using the "Homing - Home position or home offset" (s_{HOME}) parameter.

The "S ReferenceSwitch" input is not evaluated.

Danger!

This homing mode can only be used for absolute encoders (single-turn encoders / multi-turn encoders / linear encoders). Using another encoder for this mode will cause the SafeMOTION module to switch to the FAIL SAFE state.

The Fail Safe state can only be exited by powering off/on and changing the safety application!

Information:

If the SMP and/or SLP safety functions are used, then their position window must be smaller than the safety-related encoder counting range.

If one of the two position windows is configured greater than the encoder counting range, the SafeMOTION module will switch to the FAIL SAFE state.

The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

For more information, see Safe encoder counting range (only applies to SafeMOTION EnDat 2.2).

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Home offset

This mode is particularly suited for absolute encoders that provide unique position values over the entire travel range. The home offset allows the encoder position to accurately represent the machine position over the entire travel range.

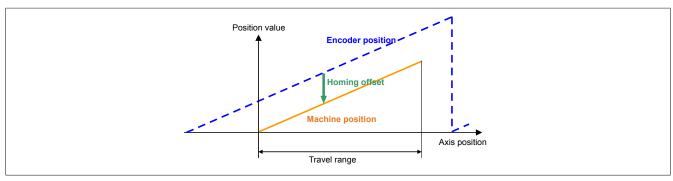

Figure 85: Homing mode - Home offset

The home offset can be determined by performing a calibration movement (e.g. homing with a reference switch).

Home offset with correction

In addition to setting the home offset, this homing mode checks to determine if the machine position is within the travel range defined by the SMP position limits. If this is not the case, the home offset in the safety-relevant encoder counting range is corrected.

Information:

The SMP safety function must be activated when using this mode. If SMP is deactivated, the SafeMOTION module switches to the FAIL SAFE state.

The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Counting range correction is needed when using absolute encoders if the encoder returns a unique position value over the entire range of movement but an encoder overflow occurs within the range of movement. In this case, the home offset depends on whether the machine was calibrated at a position to the right or the left of the overflow point.

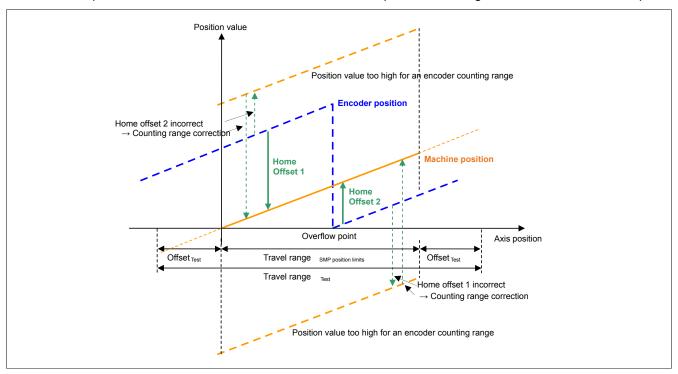

Figure 86: Homing method "Home offset with correction"

To the right of the overflow point, Home Offset 1 – which applies to the left side – would lead to an incorrect position value. To the left of the overflow point, Home Offset 2 – which applies to the right side – would lead to an incorrect position value. This can be compensated for with counting range correction.

Information:

Counting range correction only works if the encoder range is greater than or equal to the travel range! Keep in mind that only the safety-relevant part of the encoder counting range is used.

4.19 Remanent Safe Position (RSP)

Information:

This functionality is only available with Safety Release R 1.9 or later and only for ACOPOSmulti SafeMOTION EnDat 2.2 inverter modules, ACOPOS P3 SafeMOTION servo drives and ACOPOSmotor SafeMOTION!

Information:

In order to be able to use the RSP safety function:

- The axis must first be homed using the "Safe Homing" safety function. It does not matter which homing mode is used, but the respective safety notices must be observed.
- The STO and SOS safety functions must be used in accordance with the respective safety notices.

Danger!

The RSP safety function is only permitted to be used if suitable technical measures are taken to prevent impermissible movement of the axis when it is switched off (e.g. motor holding brake, self-locking gear, etc.). The axis is not in the OPERATIONAL state and not permitted to be moved further than the lag tolerance (max. half the safe absolute encoder counting range - 2 * "Standstill monitoring - Position tolerance" ($s_{SM T}$)).

$$\Delta x_{Danger} > \frac{x_{SafeEncoderRange}}{2} - 2 \cdot x_{SSM} T$$

It is the user's responsibility to take suitable technical measures to prevent excess movement.

Danger!

In order to perform testing and validation of the RSP safety function in the course of maintenance, the SafeMOTION module must have performed the RSP procedure.

Danger!

If the module is replaced, an initial homing procedure must be performed without the "S_SwitchHomingMode" or "S_Control_SwitchHomingMode" input activated.

Danger!

The RSP safety function is not suitable for continuously rotating axes. If an INT32 overflow of the safe position occurs during homing, homing using RSP will result in the FUNCTIONAL FAIL SAFE state.

4.19.1 Parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 247: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Absolute position functions - Homing (previously *Homing***)**

		0 (1) 0 /		
Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Enable RSP (Remanent safe position)	Enabled/ Disabled	Selects whether or not to use the remanent safe position	Disabled	R 1.9
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat		
(previously Remanent safe position)		2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		

Table 248: SafeMOTION parameter group: Absolute position functions - Homing

4.19.2 Behavior

The RSP safety function can be activated or deactivated via the configuration.

With this safety function, after the safe position has been homed once to the machine position, the homed safe position does not have to be homed again after a power off/on cycle. It is only possible to store valid position data after a controlled standstill of the drive. The standstill must therefore be ensured. It must also be ensured that no power is supplied to the drive while the data is being saved so that it is <u>not</u> possible for the drive to move. These requirements are met when using the STO and SOS safety functions.

Information:

If the safety function RSP is used and the inputs "S_RequestHoming" or "S_Control_Homing", "S_SwitchHomingMode" or "S_Control_SwitchHomingMode", "S_RequestSTO" or "S_Control_STO" and "S_RequestSOS" or "S_Control_SOS" on the function block are not connected, the SafeMOTION module changes to state FAIL SAFE.

The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

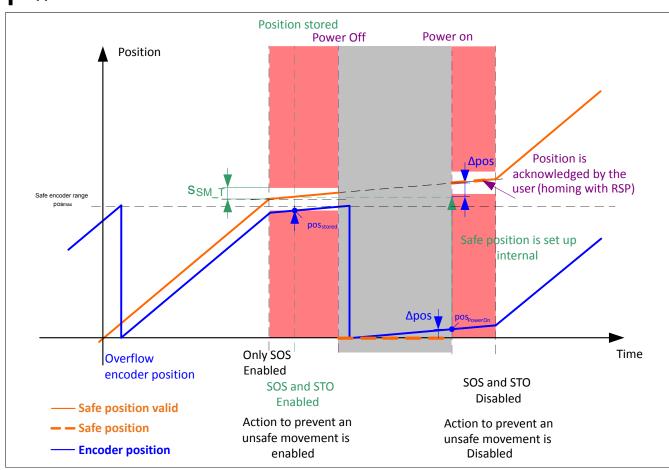

Figure 87: RSP safety function - Timing diagram with encoder overflow during power off

SafeMOTION User's Manual V 4.6.1

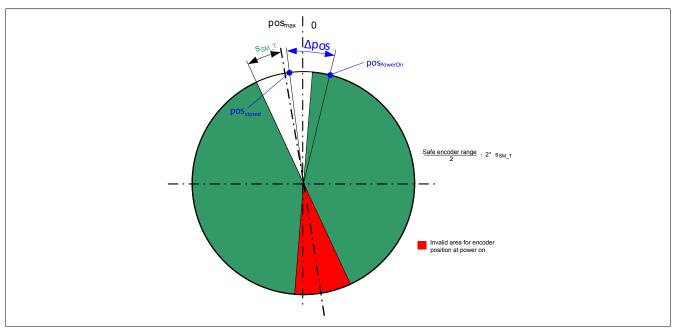

Figure 88: RSP safety function with respect to position for one revolution

4.19.2.1 RSP procedure

This safety function is not intended to provide a functional safe position following an uncontrolled machine failure. The following procedure is defined in order to achieve a controlled stop and enable the use of the remanent safe position:

- 1. Stop the axis in a controlled manner (valid safe position required).
- Achieve the "S_RSPValid" or "S_Status_RSPValid" status
 This indicates whether the position has been stored and whether homing with RSP will be possible after powering off. The following conditions must be met in order to achieve the "S_RSPValid" or "S_Status_RSP-Valid" status:
 - STO and SOS are selected.
 - STO and SOS are active and in their safe state.
 - * The axis has been homed and the safe position is valid ("S_SafePositionValid" or "S_Status_Homing" = TRUE).
 - ° The store procedure is completed after the other conditions have been fulfilled.
- 3. Activate the technical measures required to prevent a dangerous movement. Execute a power off. A dangerous movement is one that corresponds to half the safe encoder counting range minus two times "Standstill monitoring Position tolerance" (s_{SM T}).

$$\Delta x_{Danger} > \frac{x_{SafeEncoderRange}}{2} - 2 \cdot x_{SSM_T}$$

- 4. Confirm the restored position by homing with RSP after powering on.
 - To confirm the restored position after powering on, execute a homing command (i.e. positive edge of "S_RequestHoming" or "S_Control_Homing" input) with the "S_SwitchHomingMode" or "S_Control_SwitchHomingMode" input enabled.

Information:

If the switching frequency of the "S_RSPValid" or "S_Status_RSPValid" status is too fast to complete the store procedure, a warning is entered in the Safety Logger. The SOS and STO safety functions are active in this state and are not deselected until the most recent store procedure is completed.

Information:

If the module is powered on after a controlled stop and homing is performed without the "S_Switch-HomingMode" or "S_Control_SwitchHomingMode" input enabled, or if an encoder error is detected, then homing with RSP will cause the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power!

Information:

If an error or change in the configuration is detected when powering on after a controlled stop, then the position is not applied and homing with RSP will cause the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power!

Information:

If the FUNCTIONAL FAIL SAFE error state occurs when homing with RSP, the axis must be homed again with the "S_SwitchHomingMode" or "S_Control_SwitchHomingMode" input disabled in order to obtain a new, valid safe position.

4.20 Safely Limited Position (SLP)

Information:

The "Safely Limited Position" safety function is only available with Safety Release 1.4 and later!

4.20.1 Parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp monitoring - Enable de- lay time (previously <i>Delay time to start</i> ramp monitoring (us))	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 249: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 250: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SMP - Enable	Enabled/	Activates the S	SMP safety function from the configuration	Disabled	R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit	[units]	Lower position	limit for the machine's full travel range	0	R 1.4
(previously Safe Lower Position Limit for SMP (units))					
SMP - Upper position limit	[units]	Upper position	limit for the machine's full travel range	0	R 1.4
(previously Safe Upper Position Limit for SMP (units))					
SLP - Lower position limit	[units]	Lower position	limit for the monitoring range	0	R 1.4
(previously Safe Lower Position Limit for SLP (units))					
SLP - Upper position limit	[units]	Upper position	limit for the monitoring range	0	R 1.4
(previously Safe Upper Position Limit for SLP (units))					
SLP - Enable delay time	[µs]	Delay time bet	ween the SLP request and start of monitoring	0	R 1.4
(previously Delay time to start SLP (us))					

Table 251: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.20.2 Behavior

The purpose of the SLP safety function is to monitor a specified position window.

The "SLP - Lower position limit" (s_{SMP_LL}) and "SLP - Upper position limit" (s_{SMP_UL}) parameters can be used to configure the limits of the monitoring range.

Setting input "S RequestSLP" or "S Control SLP" to SAFEFALSE requests safety function SLP.

After the configurable time "SLP - Enable delay time" ($t_{\text{SLP_ED}}$) has expired, the position window is monitored.

The "S_SafetyActiveSLP" or "S_Status_SLP" status bit will be set to SAFETRUE if no errors occur while monitoring is active.

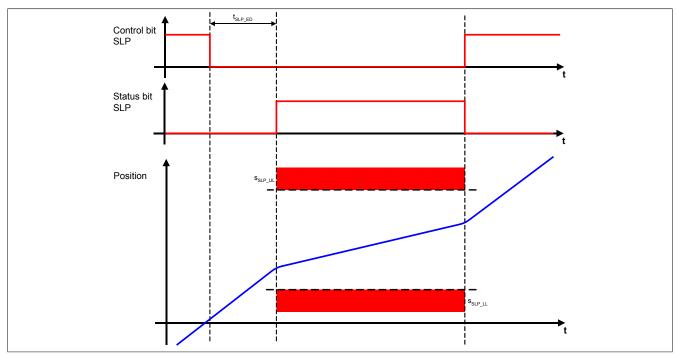

Figure 89: Safely Limited Position (SLP)

Information:

The axis must be homed successfully before using the SLP safety function.

If a homing procedure is not completed successfully or the "S_SafePositionValid" or "S_Status_Homing" status changes, then the request for the SLP safety function causes the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous.

Output "S_NotErrFUNC" or "S_Status_NotErrFunc" of the function block is reset!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

To minimize the residual distance when the position window is exceeded, a position-dependent speed limit is monitored in addition to the position.

Danger!

In the worst case, the monitored position window can be violated while the axis is coasting to a stop. This must be taken into account when defining the limits!

When the position limit is approached, the monitored speed limit is calculated in such a way that the drive will come to a full stop before the positioning limit is reached using the configured "Ramp monitoring - Speed deceleration limit" (a_{RM} _L) parameter.

Permitted speed in the direction of the upper position limit:

$$v_{LIM,POS} = \sqrt{2(LIM_{SLP,POS} - s) \cdot a}$$

Permitted speed in the direction of the lower position limit:

$$v_{LIM,NEG} = \sqrt{2(s - LIM_{SLP,NEG}) \cdot a}$$

The position-dependent speed limit is illustrated in the following figure.

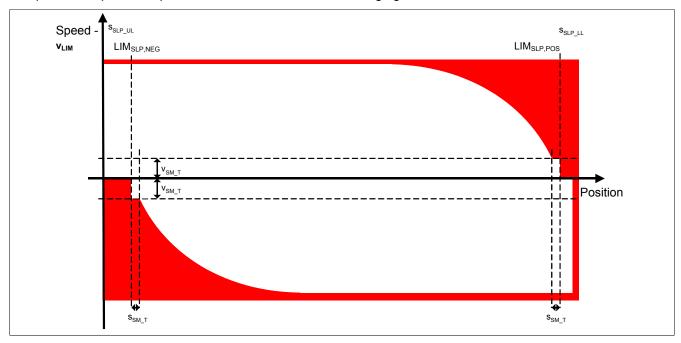

Figure 90: Position-dependent speed window

Danger!

If the position window or the position-dependent speed limit is violated while the SLP safety function is activated or the "S_SafePositionValid" or "S_Status_Homing" status is lost, then the module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The "S_NotErrFUNC" or "S_Status_NotErrFunc" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

In the event of an error, a synchronous axis will no longer be synchronous.

Danger!

If the SLP safety function is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should contain at least one violation of each position limit. The error response must be tested accordingly!

4.21 Safe Maximum Position (SMP)

Information:

The "Safe Maximum Position" safety function is only available with Safety Release 1.4 and later!

4.21.1 Parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp monitoring - Enable de- lay time (previously <i>Delay time to start</i> ramp monitoring (us))	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 252: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(units/s)) Standstill monitoring - Position	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
tolerance (previously <i>Position Tolerance</i> (units))				

Table 253: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SMP - Enable	Enabled/	Activates the S	SMP safety function from the configuration	Disabled	R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit	[units]	Lower position	limit for the machine's full travel range	0	R 1.4
(previously Safe Lower Position Limit for SMP (units))					
SMP - Upper position limit	[units]	Upper position	limit for the machine's full travel range	0	R 1.4
(previously Safe Upper Position Limit for SMP (units))					
SLP - Lower position limit	[units]	Lower position	limit for the monitoring range	0	R 1.4
(previously Safe Lower Position Limit for SLP (units))					
SLP - Upper position limit	[units]	Upper position	limit for the monitoring range	0	R 1.4
(previously Safe Upper Position Limit for SLP (units))					
SLP - Enable delay time	[µs]	Delay time bet	ween the SLP request and start of monitoring	0	R 1.4
(previously Delay time to start SLP (us))					

Table 254: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.21.2 Behavior

The difference between SMP and SLP is that SMP cannot be actively requested. It is either enabled or disabled by the configuration.

When enabled, the current position is constantly monitored against a defined position window.

The "SMP - Lower position limit" (s_{SMP_LL}) and "SMP - Upper position limit" (s_{SMP_UL}) parameters can be used to configure the limits of the monitoring range.

The SMP safety function only works with homed axes since it requires a safe absolute position.

If SMP is configured, a 15-minute timeout period begins when pulse disabling is activated. The homing procedure must take place during this time.

When homing is completed and if there were no errors during monitoring, the "S_SafetyActiveSMP" or "S_Status_SMP" status bit is set to SAFETRUE.

Information:

The axis must be homed successfully before using the "Safe Maximum Position" safety function. If the homing procedure does not complete successfully within 15 minutes after pulse disabling is activated, the "SafePositionValid" or "S_Status_Homing" status bit is lost for an already homed axis or there is a violation of the position window or position-dependent speed limit, then the SafeMOTION module switches to the FUNCTIONAL FAIL SAFE error state.

The "S_NotErrFUNC" or "S_Status_NotErrFunc" output on the function block is reset, and the drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous.

As with the SLP safety function, the SMP safety function also monitors a position-dependent speed limit in addition to the position in order to minimize the remaining distance if the position window is exceeded. See the description of safety function "Safety Limited Position (SLP)".

Danger!

In the worst case, the monitored position window can be violated while the axis is coasting to a stop. This must be taken into account when defining the limits!

If the position window has been exceeded, then movement is only possible in the direction of the position window after the FUNCTIONAL FAIL SAFE state has been acknowledged.

Attempting to move beyond the standstill tolerance in the unsafe direction (i.e. away from the position window) will cause the SafeMOTION module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Danger!

If the SMP safety function is used in the safety application, then it must be tested when commissioning the machine! The test should contain at least one violation of each position limit. The error response must be tested accordingly!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

4.22 Safe Brake Test (SBT)

Information:

This functionality is available with Safety Release R1.7 or later and for ACOPOSmulti SafeMOTION SinCos inverter modules!

Information:

This functionality is available for ACOPOS P3 SafeMOTION servo drives in hardware upgrade 1.10.2.x or later!

The function is approved starting with a defined hardware revision; for older hardware revisions, using the safety function leads directly to state FAIL SAFE. The necessary hardware revision is noted in the servo drive data sheet.

Danger!

The safe torque can only be used for synchronous motors with undefined poles $(L_d = L_q)!$

Danger!

Use of the SBT safety function requires fault exclusion for encoder shaft breakage or that safe encoder connection monitoring is active.

This requires either a safe encoder mounting, or the application must meet the necessary requirements for safe encoder shaft breakage monitoring!

Information:

Determining the added value of using this function depends on the requirements of the brake being used and is your responsibility as user.

Danger!

The SBT safety function is not a typical safety function!

It is only used to test an engaged holding brake by applying a configurable stator current for a certain period of time.

The test is carried out at the specified safety level and with the specified precision.

Danger!

Overheating of the motor can change the torque constant $k_{\scriptscriptstyle T}$ and therefore negatively influence the safe torque.

Ensure that the motor has been sized so as to prevent overheating.

Danger!

The accuracy of the safe current only applies up to the continuous current of the performance class used. It is not permitted to use a safety function that should monitor or detect a current above the continuous current of the performance class used.

4.22.1 Parameters

Group: Advanced functions - SBT (previously *Safe Brake Test*) (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION (hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBT - Threshold (previously Safe Brake Test threshold (uA))	[µA]	Threshold value for the stator current that must be exceeded during the brake test	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - External load (previously Safe Brake Test external load (uA))	[μΑ]	External load	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Position tolerance (previously Safe Brake Test position tolerance (units))	[units]	Position tolerance	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Maximum torque duration (previously Safe Brake Test maximum torque duration (us))	[µs]	Duration of the test for which the maximum torque must be present	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Test interval (previously Safe Brake Test interval (s))	[s]	Retry interval for the safe brake test	28800	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Enable delay time (previously <i>Delay Time to start</i> SBT (us))	[µs]	Delay time between the SBT request and activation of the safety function	0	R 1.7 SinCos R 1.10 ACOPOS P3

Table 255: SafeMOTION parameter group: Advanced functions - SBT

The parameters are checked when the SafeMOTION module is started up. If a parameter is invalid, the module switches to an error state. In addition, a corresponding error entry is made in the logger.

If an external load is not configured, the following guidelines apply:

 The "Safe Brake Test threshold" value must be greater than the measurement imprecision of the module being used.

The following additional guidelines apply for an external load:

- The external load is not permitted to be greater than the threshold value.
- The external load must be greater than the measurement imprecision of the module being used.

4.22.2 Behavior

The SBT safety function allows an engaged brake to be tested by applying a configurable stator current for a specified period of time.

An external load can be taken into consideration if it is configured in SafeDESIGNER using the "SBT - External load" (i_SBT_EXT_LOAD) parameter. In this case, the expected testing torque after measuring the configured load is reduced by the value for the external load.

The brake test must be performed by the standard application; the SafeMOTION module monitors this process.

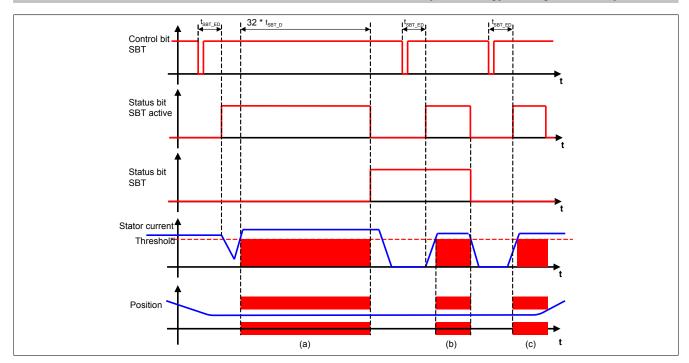

Figure 91: Safe Brake Test (SBT)

A corresponding mode is available in PLCopen function block MC BR BrakeControl.

Function block SF_SafeMC_SBT_BR_V1_00 is available in SafeDESIGNER for requesting the safe brake test.

A negative edge on control bit "SBT" starts the SBT safe brake test; status bit "SBT_Active" is set simultaneously.

As soon as the brake test has been completed successfully, status bit "SBT" is set and "SBT_Active" is reset simultaneously.

The request for the safe brake test is edge-controlled. Resetting the "SBT" control bit to SAFETRUE has no effect on the rest of the process.

Immediately after the safe brake test is requested, the actual brake test is delayed by the "SBT - Enable delay time" (t_{SBT_ED}) counter. This time allows the standard application to react to the status of the request bit and bring the axis to a standstill if necessary.

The safe brake test is handled differently depending on whether or not an external load is present at the time of the test.

4.22.3 Safe brake test without external load

If no external load is configured in SafeDESIGNER, monitoring of the load on the brake starts immediately after the "SBT - Enable delay time" ($t_{\text{SBT_ED}}$) has expired. The safe brake output is simultaneously switched to 0 V.

4.22.4 Safe brake test with configured external load

After the "SBT - Enable delay time" (t_{SBT_ED}) has expired, the value of the stator current required to hold the load is immediately checked against the expected value. This means that at the time the stator current is checked, it must be within a window of $\pm 6.25\%$ of the expected "SBT - External load" ($i_{SBT_EXT_LOAD}$) value. If it is, the safe brake output is switched to 0 V, and the stator current must be below the reduced threshold value.

Because an external load is already exerting torque on the engaged brake, the amount of torque that the drive must apply to test the brake is reduced. The test current is reduced by the amount of the configured load.

Danger!

This function cannot be used with a variable load.

Danger!

In order for the measurement of the external load to provide valid results, the load must be held by the drive at the time of measurement. This means that the brake is not permitted to be engaged!

4.22.5 Brake load monitoring

From this point on, the safe brake test procedure is the same with or without a configured external load.

The MC_BR_BrakeControl function block in the standard application ensures that the desired amount of torque is applied to the brake. The stator current is increased in a ramped form until it reaches the setpoint. From the time the stator current exceeds the threshold value "SBT - Threshold" (i_{SBT_TRESH}), the safe position is stored and a position window is calculated.

The size of the position window can be configured using the "SBT - Position tolerance" ($s_{SBT_{L}}$) parameter. The "SBT" status bit is set to "Active" simultaneously and monitoring is started.

The "SBT - Maximum torque duration" (t_{SBT_D}) parameter defines the minimum duration of the test, during which the test torque must be applied. The total duration of monitoring is 32x this time (see Fig. 91 "Safe Brake Test (SBT)" on page 405 (a)).

During this time, the test current is not permitted to fall below the threshold value; the safe position is not permitted to leave the position window.

If the stator current falls below its threshold value during active monitoring (see Fig. 91 "Safe Brake Test (SBT)" on page 405 (b)) or the position tolerance window is violated (see Fig. 91 "Safe Brake Test (SBT)" on page 405 (c)), then the safe brake test becomes invalid and is aborted. If the status bit "SBT" is already set, it is reset. In addition, a corresponding entry is made in the Safety Logger.

After a successful brake test, the "SBT" status bit is set and a configurable timer is started (Parameter "SBT - Test interval" (t_{SBT_Ti})). After this timer has expired, the "SBT" status bit is reset to indicate that a new brake test is required.

4.22.6 Accuracy of current measurement

For valid general information about current measurement and its accuracy, see 2.5.1 "Accuracy of current measurement" on page 312. The following additional notes also apply to SBT.

With SBT, current measurement can be distorted due to faulty commutation. The SBT testing principle used guarantees that this measurement error is less than 2%, however.

The accuracy of the current measurement must be applied to the threshold value. This alone ensures valid results from the brake test, even with maximum measurement error. See 4.22.7 "Calculating the current threshold value to be configured" on page 406.

4.22.7 Calculating the current threshold value to be configured

In the configuration of the threshold value of stator current i_{SBT_TRESH} (for the load or test torque), current i_{SBT_TEST} corresponding to respective test torque T_{SBT_TEST} must be determined from the torque characteristic curve (see 4.6 "Safe torque" on page 344) of the motor used; in addition, the measurement error of the testing principle and the accuracy of the safe current must also be taken into account.

i_{SBT_TEST} is calculated appropriately 4.6 "Safe torque" on page 344 as follows:

$$i_{SBT_TEST} = \sqrt{2} \cdot MAX \left| \frac{T_{SBT_TEST}}{k_T}; \left| I_0 + \frac{T_{SBT_TEST} - T_0}{\frac{T_P - T_0}{I_P - I_0}} \right| \right|$$

- $k_{\scriptscriptstyle T}$ Torque constant of the motor
- In Stall current of the motor
- I_P Peak current of the motor
- T_o Stall torque of the motor
- T_P Peak torque of the motor

Danger!

If the accuracy of the current measurement is not taken into account when setting the value that should be configured, the monitored current value or torque could be too low under certain conditions. In this case, it cannot be guaranteed that the target torque will be reached or that the torque limit will be correctly monitored; the result of the safety function is therefore invalid!

Information:

The values for the test current and duration of the test depend on the application and the brake being used; it is the user's responsibility to set these values appropriately.

4.23 Safely Limited Torque, SLT

Information:

This functionality is only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later! The function is approved starting with a defined hardware revision; for older hardware revisions, using the safety function leads directly to state FAIL SAFE. The necessary hardware revision is noted in the servo drive data sheet.

4.23.1 Parameter

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
SLT - Torque limit	[mNm]	Torque limitation monitored during activation of SLT	0	R 1.10
SLT - Enable delay time	[µs]	Delay time between the SLT request and activation of the safety function	0	R 1.10

Table 256: SafeMOTION parameter group: Advanced functions - SLT

Parameter	Unit	Description	Default value	Starting in Safety Re-
Motor - Number of pole pairs (hardware upgrade 1.10.2.x and later)	-	Number of pole pairs on the rotor circumference	1	1.10
Motor - Direction*) (hardware upgrade 1.10.2.x and later)	Standard / Inverse	Direction of rotation of the motor	Standard	1.10
Motor - Stator resistance (hardware upgrade 1.10.2.x and later)	mOhm	Ohmic stator resistance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Stator inductance (hardware upgrade 1.10.2.x and later)	μН	Stator inductance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Torque constant (hardware upgrade 1.10.2.x and later)	μNm / A	Torque constant of the motor	0	1.10
Motor - Rated speed (hardware upgrade 1.10.2.x and later)	units/s	Nominal speed of the motor	0	1.10
Motor - Stall current (hardware upgrade 1.10.2.x and later)	mA	Stall current of the motor	0	1.10
Motor - Rated current (hardware upgrade 1.10.2.x and later)	mA	Nominal current of the motor	0	1.10
Motor - Peak current (hardware upgrade 1.10.2.x and later)	mA	Peak current of the motor	0	1.10
Motor - Stall torque (hardware upgrade 1.10.2.x and later)	mNm	Stall torque of the motor that is output when the stall current is applied	0	1.10
Motor - Peak torque (hardware upgrade 1.10.2.x and later)	mNm	Peak torque of the motor that is briefly output when the peak cur- rent is applied	0	1.10
Motor - Moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	μkgm²	Mass moment of inertia of the motor. Consists of the sum of the inertias of the rotor, encoder and holding brake.	0	1.10
Motor - External moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	External mass moment of inertia, depends on the total external load	0	1.10

Table 257: SafeMOTION parameter group: General settings - Motor

4.23.2 Behavior

Safety function SLT is used to monitor the electric motor torque for compliance with a specified maximum limit.

Information:

The SLT safety function requires safe motor current evaluation. If the function is programmed in the safety application and if an error is detected in the safe motor current evaluation, then the SafeMC module immediately switches to the FUNCTIONAL FAIL SAFE state after the function block is activated!

Parameter "SLT - Torque limit" T_{SLT_L} can be used to set the limit value for the electric motor torque for the positive and negative direction of movement.

Setting the "S Control SLT" input to SAFEFALSE requests the SLT safety function.

After configurable delay time "SLT - Enable delay time" t_{SLT_ED} has elapsed, the configured motor torque limit is monitored.

^{*)} The direction of rotation of the motor is not related to the counting direction of the speed ("EUS - Counting direction"), i.e. the direction of rotation of the motor can be changed explicitly in the non-safe application and must therefore also be taken into account in SafeDESIGNER.

The purpose of delay time t_{SLT_ED} is to compensate for the different runtimes of the standard and safety applications. If the delay time is set to 0, then the motor torque limit will be monitored right after the request is made for the safety function.

The standard (non-safety-related) application must implement a closed-loop control appropriate for the level of danger to decelerate the movement and ensure adherence to the respective motor torque limit.

The "S_Status_SLT" status bit will be set to SAFETRUE if no errors occur while monitoring is active.

Information:

The SLT safety function can be activated in parallel with other safety functions. This makes it possible, for example, to reduce the expected residual distances in the worst-case calculation.

Information:

The SLT safety function has achieved its safe state when the safety function is selected and no violation is detected during monitoring of the motor torque limit of the drive.

The respective bit is set when the functional safe state has been achieved.

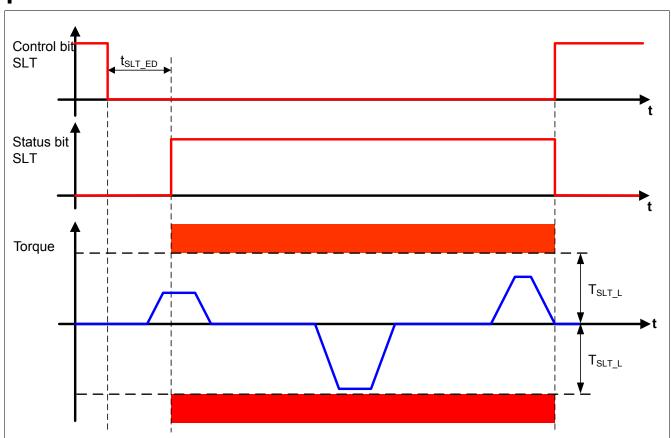

Figure 92: Safely Limited Torque, SLT

Danger!

When monitoring the safely limited motor torque, in the event of error a change in angular momentum that corresponds to the electrical dynamic behavior of the motor can occur during the error response time. The limitation of the torque cannot be ensured within the error response time. The dangerous change in angular momentum must be determined in a risk analysis and is not permitted to result in any hazard!

SafeMOTION User's Manual V 4.6.1

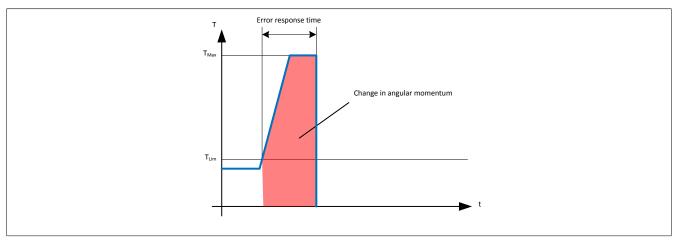

Figure 93: Possible change of the angular momentum in the event of an error

Danger!

If a motor torque limit is violated, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. Output "S_NotErrFUNC" or "S_Status_NotErrFunc" of the function block is reset!

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Danger!

If the safety function is used in the safety application, then it must be tested when commissioning the machine by selecting and deselecting it!

The test should contain at least one violation of each configured limit. The error response must be tested accordingly!

Danger!

The safe torque can only be used for synchronous motors with undefined poles $(L_d = L_o)!$

Danger!

Overheating of the motor can change the torque constant k_T and therefore negatively influence the safe torque. Ensure that the motor has been sized so as to prevent overheating.

Danger!

If the accuracy of the current measurement is not taken into account when setting the value that should be configured, the monitored current value or torque could be too low under certain conditions. In this case, it cannot be guaranteed that the target torque will be reached or that the torque limit will be correctly monitored; the result of the safety function is therefore invalid!

The accuracy of the safe current only applies up to the continuous current of the performance class used. It is not permitted to use a safety function that should monitor or detect a current above the continuous current of the performance class used.

4.23.3 Accuracy of current measurement

For valid general information about current measurement and its accuracy, see 2.5.1 "Accuracy of current measurement" on page 312. The following additional notes also apply to SLT.

In order to calculate the motor torque, the accuracy of the current measurement must be applied. This alone ensures valid results from the SLT safety function, even with maximum measurement error. See 4.23.4 "Calculating the electrical motor torque limit to be configured" on page 411.

Chapter 6 Safety technology

4.23.4 Calculating the electrical motor torque limit to be configured

In the configuration of torque limit T_{SLT} , current i_{SLT_LIM} corresponding to required torque limit T_{LIM} must be determined from the torque characteristic curve (see 4.6 "Safe torque" on page 344) of the motor used; in addition, the accuracy of the safe current must also be taken into account. i_{SLT} must then be calculated back to a torque.

 $i_{\text{SLT_LIM}}$ is calculated according to the 4.6 "Safe torque" on page 344 as follows:

$$i_{SLT_LIM} = \sqrt{2} \cdot MAX \left(\frac{T_{LIM}}{k_T}; \left| I_0 + \frac{T_{LIM} - T_0}{\frac{T_P - T_0}{I_P - I_0}} \right| \right)$$

The accuracy of the safe current of the power classes of the servo drive must then be added.

$$i_{SLT} = i_{SLT_LIM} + safe current accuracy$$

Transforming it back into a torque value results in the torque limit to be configured for the safety function.

$$T_{SLT} = MIN \left(k_T \frac{i_{SLT}}{\sqrt{2}}; T_0 \frac{T_P - T_0}{I_P - I_0} \left(\frac{i_{SLT}}{\sqrt{2}} - I_0 \right) \right)$$

- k_⊤ Torque constant of the motor
- I₀ Stall current of the motor
- I_P Peak current of the motor
- T₀ Stall torque of the motor
- T_P Peak torque of the motor

4.24 Safe machine options

4.24.1 Parameters

Group: Safe machine options (previously Additional Parameter)

•		,		
Parameter	Unit	Description	Default value	Used starting in Safety Release
Safe machine options - Enable (previously <i>Activate Safe Machine Options</i>)	Enabled/ Disabled	Activates/Deactivates the "Safe machine options" safety function	Disabled	R 1.9

Table 258: SafeMOTION parameter group: Safe machine options

4.24.2 Behavior

The primary method for configuring a SafeMOTION module is to set the parameters in SafeDESIGNER and transfer them to the SafeLOGIC controller along with the safety application. From there, they are transferred to the SafeMOTION module. These parameters are labeled as "Default parameters" and require the use of SafeDESIGNER.

To allow them to be configured without using SafeDESIGNER, Safety Release 1.9 introduces the "Safe machine options" safety function.

"Safe machine options" is used to modify the parameters of the SafeMOTION module from the standard application.

The safe machine options are transferred from the standard application to the SafeLOGIC controller as a data block, and stored there permanently. The SafeMOTION module needs to restart in order to transfer the safe machine options, and in some cases this occurs automatically. This means that the parameters cannot be changed at runtime.

Information:

It is only possible to use the "Safe machine options" safety function:

- · On SG4 target systems
- With SafeLOGIC X20SL8100
- With Automation Runtime AR 4.06 or later

Danger!

Changing the module's parameters using the "Safe machine options" is equivalent to modifying the safety application.

Acknowledgment and unlock requests must be handled by authorized personnel only. Automated acknowledgment and unlocking logic is not permitted. This requirement must be listed in a code review document.

The danger warnings in the "Maintenance scenarios" chapter of the technical data sheets for X20SL8xxx and X20SLXxxx series devices must also be observed. Functions are only permitted to be executed by personnel with proper authorization. Access to the respective visualization components must be limited to the authorized group of personnel using suitable means.

Personnel authorized to acknowledge data are responsible for verifying the data that is to be acknowledged (project CRC, project save date, content of machine options, etc.).

Local personnel must be informed whenever access takes place. The user must implement suitable measures to ensure that remote access is not possible without notifying local personnel.

Proper functionality must be verified by comprehensive functional testing. All test procedures and results must be documented. Testing must be able to identify any data mismatches between the HMI application and safety application. Comprehensive functional testing must be carried out to ensure proper functionality after the standard application is created or modified as well as after any changes are made to Automation Runtime.

The following description assumes that the "Safe machine options - Enable" module parameter has been set to "Enabled".

4.24.3 Transferring to the SafeLOGIC controller

The safeDownloadData() function block from the AsSafety library is used to transfer the safe machine options. For information regarding the use of this function block, see library AsSafety in Automation Help.

As mentioned above, the safe machine options are transferred as a data block. This data block contains a 64-byte array, variables for version identification and the safety parameters themselves. The format of the safe machine options depends on the Safety Release of the module type (see "4.24.6" Data structure of safe machine options (Safety Release 1.9 and later)" on page 414").

In Safety Release 1.9 and later, a structure type is provided in library "SafeMC" for SafeMOTION modules. Please note the minimum required ACP10 version (see 3 "System requirements" on page 265).

Since the entire safe machine option data block is always transferred, the "enable bits" can be used to enable each parameter. Each bit corresponds to a parameter. For parameters whose "enable bit" is set, the default value (as configured in SafeDESIGNER) is overwritten by the value in the structure. For parameters whose "enable bit" is not set, the default value (as configured in SafeDESIGNER) is retained.

Information:

When the safe machine options are transferred to the SafeLOGIC controller, their ranges are not checked. It is therefore possible to set values that are outside the valid ranges. To prevent malfunctions, the range check is performed on the SafeMOTION module. If faulty parameter settings are detected, the SafeMOTION module enters the FAIL SAFE state during startup.

Information:

The application that handles the transfer must be developed in accordance with currently applicable regulations. Manipulation of parameters by unauthorized personnel is not permitted and must be prevented.

After parameters have been changed, a complete functional test must be performed in order to ensure that the behavior of the safety application meets specifications.

Information:

The format of the safe machine options is backward compatible.

4.24.4 Transferring to the SafeMOTION module

Transfer always takes place in state PREOPERATIONAL. If the safe machine options on the SafeLOGIC controller are by a download, they are transferred automatically to the respective SafeMOTION module. On the SafeMOTION module, each of the "enable bits" is evaluated; for any that are set, the default value of the corresponding parameter is overwritten by the value of the safe machine option. Each parameter has a valid range of values which may depend on the values of other parameters (SMS/SLS speed limits, etc.). This range of values is checked on the SafeMOTION module.

If faulty parameter settings are detected, the SafeMOTION module enters the FAIL SAFE state and a corresponding error is entered in the Safety Logger.

4.24.5 Missing safe machine options

If the "Safe machine options" safety function is activated, then the safe machine options must be found on the SafeLOGIC controller. If there is no data block for the respective SafeMOTION module, then the SafeMOTION module does not switch to the OPERATIONAL state and can therefore not be used.

Downloading safe machine options to the SafeLOGIC controller triggers an automatic restart of the SafeMOTION module, and the safe machine options are transferred from the SafeLOGIC controller to the SafeMOTION module.

4.24.6 Data structure of safe machine options (Safety Release 1.9 and later)

Data structure of safe machine options:

- ACOPOSmulti SafeMOTION EnDat 2.2 (Safety Release 1.9 and later)
- ACOPOSmotor SafeMOTION (Safety Release 1.10 and later)
- ACOPOSmulti SafeMOTION SinCos (Safety Release 1.9 and later)

Parameters that are set using a drop-down menu in SafeDESIGNER have a specific range of values, which is listed in the following table for each parameter.

Data type	EnDat 2	2.2	SinCos		Name	Constant / Name	e in SafeDE	SIGNER
- u.u. 1, po	Index	Byte offset	Index	Byte offset			· • • · · · · · · ·

Safety technology • Integrated safety functions

In order for the SafeMOTION module to interpret and verify the data correctly, information regarding module type, size and version must be entered in the structure. The structure elements "StructInfoAxisTypeID", "StructInfoSize" and "StructInfoVersion" are provided for this purpose.

For these structure elements, the correct values must be entered for the module type and structure version being used.

Variable	ACOPOSmulti SafeMOTION	ACOPOSmulti SafeMOTION	ACOPOSmotor SafeMOTION	ACOPOS P3 SafeMOTION		
	EnDat 2.2	SinCos		1-axis module		3-axis mod- ule
				mouule	mouule	ule
StructInfoAxisTypeID	1	2	1	3	4	5
StructInfoSize	196	220	196	224	448	672
StructInfoVersion	4	5	4	6	7	8

Safety Release 1.10 and later, hardware upgrade 1.10.2.x and later:

Variable	ACOPOSmulti SafeMOTION	ACOPOSmulti SafeMOTION	ACOPOSmotor SafeMOTION	ACOPOS P3 SafeMOTION		
	EnDat 2.2	SinCos		1-axis module		3-axis mod- ule
StructInfoAxisTypeID	1	2	1	3	4	5
StructInfoSize	204	228	196	340	680	1020
StructInfoVersion	13	12	4	9	10	11

Danger!

Entering the wrong values will cause the data to be interpreted incorrectly and may result in dangerous situations when using the SafeMOTION module.

5 LED status indicators

For ACOPOSmulti SafeMOTION inverter modules, see 2 "Status indicators" on page 30.

For ACOPOSmotor SafeMOTION modules, see 2 "Status indicators" on page 169.

For ACOPOS P3 SafeMOTION servo drives, see 1.2.1 "Status indicators" on page 207.

6 SafeMOTION register description

6.1 Parameters in the I/O configuration of the SafeMOTION module

Group: Function model

Parameter	Unit	Description	Default value	
Function model		This parameter is reserved for future functional expansions.	Default	

Table 263: SafeMOTION I/O configuration parameters: Function model

Parameter		Description D		Unit			
Module supervised	System behavior when	a module is missing	On	-			
	Parameter value	Description					
	On	On A missing module causes service mode to be activated.					
	Off	Off A missing module is ignored.					
SafeDOMAIN ID	In applications with mu	ultiple SafeLOGIC controllers, this parameter specifies	Assigned				
	the module's association	the module's association with a particular SafeLOGIC controller. automatically					
	Permissible values: 1 to 1024						
SafeNODE ID	Unique safety address	of the module	Assigned	-			
	Permissible val	ues: 2 to 1023	automatically				

Table 264: I/O configuration parameters: General

Group: Extended

Parameter	Unit	Description	Default value
Turn-off delay in µs		This parameter defines the delay before the SafeMOTION module should turn off if POWERLINK communication is lost. This parameter is obsolete in hardware upgrade 1.10.2.x and later! The function-	
		ality is replaced by the blackout mode!

Table 271: SafeDESIGNER parameters: Safety response time

Information:

Safe parameters are divided into module-specific and axis-specific parameters. Module-specific parameter apply once per module, while axis-specific parameters apply once per axis.

Information:

The following SafeMOTION parameter groups are module-specific:

• Safe machine options

Information:

The following SafeMOTION parameter groups are axis-specific:

- General settings ...
- Basic functions ...
- Speed functions ...
- Advanced functions ...
- Absolute position functions ...

Group: Safe machine options (previously Additional Parameter)

Parameter	Unit	Description	Default value	Used starting in Safety Release
Safe machine options - Enable	Enabled/ Disabled	Activates/Deactivates the "Safe machine options" safety function	Disabled	R 1.9
(previously Activate Safe Machine Options)				

Table 272: SafeMOTION parameter group: Safe machine options

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit			Default value	Used Starting in Safety Release
Automatic reset on start - En-	Enabled/	Activates automatic reset of the function block at startup		Disabled	R1.3
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 273: SafeMOTION parameter group: General settings - Automatic reset on start

Danger!

Parameter "Automatic reset on start" enables/disables the restart interlock during startup or when a network failure occurs on a reestablished network connection.

If parameter "Automatic reset on start" is set to "Enabled", then the module automatically changes to state OPERATIONAL state (i.e. pulse disabling and the motor holding brake are enabled)!

Configuring an automatic restart can result in critical safety conditions. Take additional measures to ensure proper safety-related functionality.

Group: General settings - Behavior of Functional Fail Safe (FFS) (previously *Behavior of Functional Fail Safe*)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
FFS - Mode	STO / STO1 and STO	In the FUNCTIONAL FAIL SAFE state, STO and SBC are activated immediately, or STO1 is activated and then STO after a delay.		STO	R 1.3
(previously Behavior of Func-	with time delay	Value	Description		
tional Fail Safe)		STO	In the FUNCTIONAL FAIL SAFE state, STO and SBC are activated immediately.		
		STO1 and STO with time delay	In the FUNCTIONAL FAIL SAFE state, STO1 and SBC are activated first, and then STO after a delay.		
FFS - STO Enable delay time (previously Delay for STO in Functional Fail Safe [µs])	[µs]	Delay time between STO1 and STO (and SBC) in the FUNCTIONAL FAIL 0 SAFE state		0	R 1.3
FFS - Delay time until brake engages (previously Delay time until the brake engages [µs])	[µs]	Delay time before the brake engages The second enable channel is activated after this delay time if STO1 and time-delayed STO and SBC are configured for FUNCTIONAL FAIL SAFE.		0	R 1.3
FFS - Caused by encoder error (1.10.1.x for ACOPOSmulti SafeMOTION and hardware upgrade 1.10.2.x or later for ACOPOS P3 SafeMOTION)	Always / Only if safety functions re- quiring an encoder are enabled				R 1.10.1

Table 274: SafeMOTION parameter group: General settings - Behavior of Functional Fail Safe (FFS)

SafeMOTION User's Manual V 4.6.1

Group: General settings - Blackout Mode

Parameter	Unit	Description		Default value	Used starting with Safe- ty Release
BM - Mode	Off /	The blackout mode defines the behave	vior in case of network failure.	Off	R 1.10
(hardware upgrade 1.10.2.x	Prev. enabled	Value	Description		
and SF /	Prev. enabled and configured SF /	Off	In the event of a network failure, as before the axis enters state IDLE of the SafeMOTION module's state machine.		
	Configured SF	Prev. enabled SF	The safety functions requested at the time of the network failure remain active during the blackout mode.		
		Prev. enabled and configured SF	The safety functions requested at the time of the network failure remain active during the blackout mode; in addition, the safety functions configured in "BM - Configured safety functions" are requested.		
		Configured SF	At the time of the network failure, the safety functions configured in "BM - Configured safety functions" are requested.		
BM - Delay time to FFS (hardware upgrade 1.10.2.x and later)	[µs]	Delay time between start of blackout the change to state FUNCTIONAL FA	0	R 1.10	
BM - Configured safety func- tions (hardware upgrade 1.10.2.x and later)	-	Configuration mask of the safety functioned. Control bit = 0 Safety function required control bit = 1 Safety function not in	4294967295 (0xFFFF FFFF)	R 1.10	

Table 275: SafeMOTION parameter group: General settings - Blackout Mode

Group: General settings - Encoder Unit System (previously *Encoder Unit System*)

Parameter	Unit	Description	Default value	Starting in Safety Release
EUS - Encoder type (previously <i>Encoder Type</i>) (SSO starting with hardware upgrade 1.10.2.x)	Rotary encoder / Linear encoder / Encoder used / Encoder not used / Safe Speed Observer - Rotatory / Safe Speed Observer - Linear	ACOPOSmulti SafeMOTION SinCos (Safety Release 1.7 and later) Rotary encoder Linear encoder Encoder not used: No encoder being used ACOPOSmulti SafeMOTION EnDat 2.2 (Safety Release 1.9 or later) ACOPOSmotor SafeMOTION (Safety Release 1.10 or later) Encoder used: Safe encoder evaluation enabled Encoder not used: Safe encoder evaluation disabled ACOPOS P3 SafeMOTION (Safety Release 1.10 and later) Encoder used: Safe encoder evaluation enabled Encoder used: Safe encoder evaluation disabled Safe Speed Observer - Rotatory: SSO enabled for rotary systems (hardware upgrade 1.10.2.x and later) Safe speed observer - Linear: SSO enabled for linear systems (hardware upgrade 1.10.2.x and later)		R 1.7
EUS - Number of signal periods (previously <i>Number of signal periods</i>) (only with ACOPOSmulti SafeMOTION SinCos)	-	Number of signal periods per revolution (rotary encoder) or length of the physical reference system (linear encoder)	1	R 1.7
EUS - Count of physical reference system (previously Count of physical reference system)	-	Rotary encoder unit scale: X revolutions Linear encoder unit scale: X reference lengths (reference length = length of the physical reference system) Any unit (mm, 1/100 mm, 1/20 inch, degree of angle, etc.) can be used for positions (and data that can result such as speed and acceleration). For this reason, the relationship between an integer multiple of this unit (units per x revolutions / units per x reference lengths) and a certain num- ber of x revolutions / x reference lengths has to be previously defined.	1	R 1.4

Table 276: SafeMOTION parameter group: General settings - Encoder Unit System

Parameter	Unit	Description	Description		Starting in Safety Release
EUS - Units per count of physical reference system	[units]	Rotary encoder unit scale: Units per x revolutions Linear encoder unit scale: Units per x reference lengths		1000	R 1.4
(previously Units per count of physical reference system [units])		Any unit (mm, 1/100 mm, 1/20 inch, degree of angle, etc.) can be used for positions (and data that can result such as speed and acceleration). For this reason, the relationship between an integer multiple of this unit (units per x revolutions / units per x reference lengths) and a certain number of x revolutions / x reference lengths has to be previously defined.			
EUS - Counting direction	Standard /	Counting dire	ection of the position or speed	Default	R 1.3
	Inverse	Value	Description		
(previously Counting direction)		Default	Encoder counting direction is equal to the counting direction of the unit system.		
		Inverse	Encoder counting direction is negative to the counting direction of the unit system.		
EUS - Length of physical reference system for linear encoder	[nm]	For linear measurement systems, the length of a physical reference system is defined here. This value is not used for rotary encoders, where the reference system is a single revolution.		100000000	R 1.4
(previously Length of physical reference system for linear en- coder (nm))					
EUS - Maximum speed to nor- malize speed range	[units/s]	Maximum spe	eed to which the displayed speed should be normalized	32767	R 1.3
(previously Maximum speed to normalize the speed range (units/s))					
EUS - Encoder acceleration limit	[rad/s²] or [mm/s²]	Maximum pe	rmissible encoder acceleration	100000	R 1.4
(previously Maximum acceler- ation (rad/s² or mm/s²))					

Table 276: SafeMOTION parameter group: General settings - Encoder Unit System

Information:

The physical drive speed is not permitted to exceed the value set for parameter "EUS - Maximum speed to normalize speed range"; otherwise, the SafeMOTION module will switch to the error state!

Danger!

If the manufacturer of the measuring instrument specifies a limitation of the maximum acceleration, this must be monitored by the SafeMOTION module. The acceleration to be monitored can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Incorrectly configuring the unit system can result in dangerous situations.

When validating the application, the monitored speed limits must be intentionally violated and their physical values tested! The same must also be done for the monitored direction of rotation!

Group: General settings - Motor (only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later)

Parameter	neter Unit Description		Default value	Starting in Safety Re- lease
Motor - Number of pole pairs (hardware upgrade 1.10.2.x and later)	-	Number of pole pairs on the rotor circumference	1	1.10
Motor - Direction*) (hardware upgrade 1.10.2.x and later)	Standard / Inverse	Direction of rotation of the motor	Standard	1.10
Motor - Stator resistance (hardware upgrade 1.10.2.x and later)	mOhm	Ohmic stator resistance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Stator inductance (hardware upgrade 1.10.2.x and later)	μН	Stator inductance measured between two connections (phase - phase) of the motor		1.10
Motor - Torque constant (hardware upgrade 1.10.2.x and later)	μNm / A	Torque constant of the motor	0	1.10
Motor - Rated speed (hardware upgrade 1.10.2.x and later)	units/s	Nominal speed of the motor	0	1.10
Motor - Stall current (hardware upgrade 1.10.2.x and later)	mA	Stall current of the motor	0	1.10
Motor - Rated current (hardware upgrade 1.10.2.x and later)	mA	Nominal current of the motor	0	1.10

Table 277: SafeMOTION parameter group: General settings - Motor

Safety technology • SafeMOTION register description

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Motor - Peak current (hardware upgrade 1.10.2.x and later)	mA	Peak current of the motor	0	1.10
Motor - Stall torque (hardware upgrade 1.10.2.x and later)	mNm	Stall torque of the motor that is output when the stall current is applied	0	1.10
Motor - Peak torque (hardware upgrade 1.10.2.x and later)	mNm	Peak torque of the motor that is briefly output when the peak current is applied	0	1.10
Motor - Moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	μkgm²	Mass moment of inertia of the motor. Consists of the sum of the inertias of the rotor, encoder and holding brake.	0	1.10
Motor - External moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	μkgm²	External mass moment of inertia, depends on the total external load	0	1.10

Table 277: SafeMOTION parameter group: General settings - Motor

Group: General settings - SSO (only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
SSO - Speed tolerance safe speed (hardware upgrade 1.10.2.x and later)	% of the nominal speed of the motor	Permissible dev encoder speed	iation of the observed safe speed from the actual	10	1.10
SSO - Inverter switching frequency (hardware upgrade 1.10.2.x and later)	Hz	Switching freque	ency of the servo drive	5000	1.10
SSO - Inverter adjustment amplifica- tion factor (hardware upgrade 1.10.2.x and later)	10-3	Correction of the normalized gain factor of the inverter characteristic curve		0	1.10
SSO - Inverter adjustment exponent (hardware upgrade 1.10.2.x and later)	10 ⁻³ / A	Correction of the exponent of the inverter characteristic curve		0	1.10
SSO - External load - Enable (hardware upgrade 1.10.2.x and later)	Enabled/Disabled	Uses external energies (external load or suspended axes) with an enabled observer		Enabled	1.10
		Value	Description		
		Enabled	An external load / suspended load is used.		
		Disabled	No external load / suspended load is used.		

Table 278: SafeMOTION parameter group: General settings - SSO

^{*)} The direction of rotation of the motor is not related to the counting direction of the speed ("EUS - Counting direction"), i.e. the direction of rotation of the motor can be changed explicitly in the non-safe application and must therefore also be taken into account in SafeDESIGNER.

Group: General settings - Encoder monitoring (previously *Encoder Monitoring*)

Parameter	Unit	Description		Default value	Starting in Safety Release
Encoder monitoring - Safe En-	From motor data	Status of the proof	of fatigue strength of the encoder mounting	From motor data	R1.10
coder Mounting (Hardware up-	record / Approved	Value	Description	record	
grade 1.10.3.x and later)	by user	From motor data record	The status of the encoder mounting is determined using the motor data record.		
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.		
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the tule	Enabled	R1.3
		Value	Description		
(previously Encoder Position		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Speed error monitoring - Enable	Enabled/ Disabled			Enabled	R1.3
		Value	Description		
(previously Encoder Speed		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Position setpoint alive testing (SPA) -	Enabled/ Disabled	Activates/Deactivates the monitor that detects whether the position setpoint generated on the SafeMOTION module is frozen.		Disabled	R1.3
Enable		Value	Description		
(Enabled	Monitoring active		
(previously Set position alive testing)		Disabled	Monitoring not active		
Encoder monitoring - Position error tolerance	[units]	Position lag error tolerance for shaft breakage monitoring		0	R1.3
(previously Encoder monitor- ing Position tolerance (units))					
Encoder monitoring - Speed error tolerance	[units/s]	Speed error tolerance for encoder monitoring		0	R1.3
(previously Encoder monitor- ing Speed tolerance (units/s))					

Table 279: SafeMOTION parameter group: General settings - Encoder monitoring

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

•	•	5 (1)		,
Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 280: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously Early Limit Monitoring)	Enabled/ Disabled	Deceleration rample below the lower limiter "Early limit monitor falls below the endamount of time, the vated prematurely		R 1.3	
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 281: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp monitoring - Enable de- lay time (previously <i>Delay time to start</i> ramp monitoring (us))	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 282: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel High-side/		Selects the high-side or low-side IGBT in the STO1 function		High-side	R 1.3
	Hig	Value	Description		
(previously Channel selection for One Channel STO (STO1))		High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 283: SafeMOTION parameter group: Basic functions - STO1

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled	Activates ramp-based monitoring (in addition to time-based monitoring) when the SS1 function is requested		Enabled	R 1.3
		Value	Description		
		En- abled Dis- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time. When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously Ramp Monitoring Time for SS1 (us))	[µs]	Deceleration ramp monitoring time for SS1		0	R 1.3

Table 284: SafeMOTION parameter group: Basic functions - SS1

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 285: SafeMOTION parameter group: Basic functions - SBC

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description	Description D		Starting in Safety Release
		Activates rample SS2 function is	p monitoring (in addition to time-based monitoring) when the s requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration r	Deceleration ramp monitoring time for SS2		R 1.3

Table 286: SafeMOTION parameter group: Speed functions - SS2

SafeMOTION User's Manual V 4.6.1

Group: Speed functions - SLA (previously Safely Limited Acceleration)

Parameter Unit		Description	Default value	Starting in Safety Release	
SLA - Acceleration limit in positive direction	[units/s²]	Limit value for acceleration in the positive direction of movement	0	R 1.9	
(previously Safe acceleration limit for SLA (units/s²) in positive direction)					
SLA - Deceleration limit in positive direction	[units/s²]	Limit value for deceleration in the positive direction of movement	0	R 1.9	
(previously Safe deceleration limit for SLA (units/s²) in positive direction)					
SLA - Acceleration limit in negative direction	[units/s²]	Limit value for acceleration in the negative direction of movement	0	R 1.9	
(previously Safe acceleration limit for SLA (units/s²) in negative direction)					
SLA - Deceleration limit in negative direction	[units/s ²]	Limit value for deceleration in the negative direction of movement	0	R 1.9	
(previously Safe deceleration limit for SLA (units/s²) in negative direction)					
SLA - Enable delay time	[µs]	Delay time between the SLA request and activation of the safety function	0	R 1.9	
(previously Delay time to start SLA (us))					

Table 287: SafeMOTION parameter group: Speed functions - SLA

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SMS - Enable	Enabled/	Activates the S	MS safety function by configuration	Enabled	R 1.3
	Disabled	Value	Description		
(previously Safe Maximum		Enabled	SMS activated		
Speed)		Disabled	SMS deactivated		
SMS - Speed limit	[units/s]	Speed limit of t	he maximum speed (SMS)	0	R 1.3
(previously Maximum Speed for SMS (units/s))					
SLS1 - Speed limit	[units/s]	Speed limit 1 fo	or SLS (SLS1)	0	R 1.3
(previously Safe Speedlimit 1 for SLS (units/s))					
SLS2 - Speed limit	[units/s]	Speed limit 2 fo	or SLS (SLS2)	0	R 1.3
(previously Safe Speedlimit 2 for SLS (units/s))					
SLS3 - Speed limit	[units/s]	Speed limit 3 fo	or SLS (SLS3)	0	R 1.3
(previously Safe Speedlimit 3 for SLS (units/s))					
SLS4 - Speed limit	[units/s]	Speed limit 4 fo	or SLS (SLS4)	0	R 1.3
(previously Safe Speedlimit 4 for SLS (units/s))					
SLS - Ramp monitoring - Enable	Enabled/ Disabled	Activates ramp	-based monitoring (in addition to time-based monitoring) when	Enabled	R 1.3
	2.500.00	Value	Description		
(previously Rampmonitoring for SLS)		Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		

Table 288: SafeMOTION parameter group: Speed functions - SMS/SLS

Parameter	Unit	Description	Default value	Starting in Safety Release
SLS1 - Ramp monitoring - Time (previously <i>Ramp Monitoring</i> <i>Time for SLS1 (us)</i>)	[µs]	Deceleration ramp monitoring time for SLS1	0	R 1.3
SLS2 - Ramp monitoring - Time (previously <i>Ramp Monitoring</i> <i>Time for SLS2 (us)</i>)	[µs]	Deceleration ramp monitoring time for SLS2	0	R 1.3
SLS2 - Ramp monitoring - Time (previously <i>Ramp Monitoring</i> <i>Time for SLS3 (us)</i>)	[µs]	Deceleration ramp monitoring time for SLS3	0	R 1.3
SLS4 - Ramp monitoring - Time (previously <i>Ramp Monitoring</i> <i>Time for SLS4 (us</i>))	[µs]	Deceleration ramp monitoring time for SLS4	0	R 1.3

Table 288: SafeMOTION parameter group: Speed functions - SMS/SLS

Danger!

The respective monitored speed limit must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous speed cannot be exceeded in the event of error.

The dangerous speed must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SOS} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} \leq EUS - Maximum \ speed \ to \ normalize \ speed \ range$

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time (previously <i>Delay time to start</i> SDI (us)	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3

Table 289: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Advanced functions - SLI (previously Safely Limited Increment)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLI - Position limit (previously Safe Increments (units))	[units]	Maximum movable increments when SLI is active	0	R 1.3
SLI - Disable delay time (previously <i>SLI Off Delay (μs)</i>)	[µs]	Switch off delay of SLI	0	R 1.3

Table 290: SafeMOTION parameter group: Advanced functions - SLI

Danger!

The maximum increment range must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SBT (previously *Safe Brake Test*) (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION (hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in Safety Release	
SBT - Threshold (previously Safe Brake Test threshold (uA))	[µA]	Threshold value for the stator current that must be exceeded during the brake test	0	R 1.7 SinCos R 1.10 ACOPOS P3	
SBT - External load (previously Safe Brake Test external load (uA))	[µA]	External load	0	R 1.7 SinCos R 1.10 ACOPOS P3	
SBT - Position tolerance (previously Safe Brake Test position tolerance (units))	[units]	Position tolerance	0	R 1.7 SinCos R 1.10 ACOPOS P3	
SBT - Maximum torque duration (previously Safe Brake Test maximum torque duration (us))	[µs]	Duration of the test for which the maximum torque must be present	0	R 1.7 SinCos R 1.10 ACOPOS P3	
SBT - Test interval (previously Safe Brake Test interval (s))	[s]	Retry interval for the safe brake test	28800	R 1.7 SinCos R 1.10 ACOPOS P3	
SBT - Enable delay time (previously <i>Delay Time to start</i> SBT (us))	[µs]	Delay time between the SBT request and activation of the safety function	0	R 1.7 SinCos R 1.10 ACOPOS P3	

Table 291: SafeMOTION parameter group: Advanced functions - SBT

Group: Advanced functions - SLT (only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description		Starting in Safety Re- lease
SLT - Torque limit	[mNm]	Torque limitation monitored during activation of SLT	0	R 1.10
SLT - Enable delay time	[µs]	Delay time between the SLT request and activation of the safety function	0	R 1.10

Table 292: SafeMOTION parameter group: Advanced functions - SLT

Group: Absolute position functions - Homing (previously *Homing***)**

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Mode (previously <i>Mode</i>)	Direct / Reference switch / Home Offset / Home offset with correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Direct	R 1.4
Homing - Home position or home offset (previously Home Position or Home Offset (units))	[units]	Home position or home offset	0	R 1.4
Homing - Enable RSP (Rema- nent safe position) (previously Remanent safe po- sition)	Enabled/ Disabled	Selects whether or not to use the remanent safe position This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.9
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2. ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.4
(previously Reference pulse) Homing - Blocking distance (previously Blocking distance (% encoder reference system))		Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders. This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		R 1.4
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse		R 1.4
Homing - Monitoring time (previously <i>Homing Monitoring Time</i> (μs))	[µs]	Monitoring time for the homing procedure	0	R 1.4

Table 293: SafeMOTION parameter group: Absolute position functions - Homing

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Description		Starting in Safety Release
SMP - Enable	Enabled/	Activates the S	SMP safety function from the configuration	Disabled	R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit	[units]	Lower position	limit for the machine's full travel range	0	R 1.4
(previously Safe Lower Position Limit for SMP (units))					
SMP - Upper position limit	[units]	Upper position	limit for the machine's full travel range	0	R 1.4
(previously Safe Upper Position Limit for SMP (units))					
SLP - Lower position limit	[units]	Lower position	limit for the monitoring range	0	R 1.4
(previously Safe Lower Position Limit for SLP (units))					
SLP - Upper position limit	[units]	Upper position	limit for the monitoring range	0	R 1.4
(previously Safe Upper Position Limit for SLP (units))					
SLP - Enable delay time	[µs]	Delay time be	tween the SLP request and start of monitoring	0	R 1.4
(previously Delay time to start SLP (us))					

Table 294: SafeMOTION parameter group: Absolute position functions - SMP/SLP

SafeMOTION User's Manual V 4.6.1

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

6.3 Parameter names

Changed parameter names in Safety Release 1.10 and later

Parameter		
Previous name	Name in Safety Release 1.10 and later	Formula symbols
Basic	Basic	
Min_required_FW_Rev	Min required firmware revision	
Optional	Availability	
External_UDID	-	
Safety_Response_Time	Safety Responsetime	
Manual_Configuration	Manual Configuration	
Max_X2X_CycleTime_us	-	
Max_Powerlink_CycleTime_us	-	
Max_CPU_CrossLinkTask_CycleTime_us	-	
Min_X2X_CycleTime_us	-	
Min_Powerlink_CycleTime_us	-	
Min_CPU_CrossLinkTask_CycleTime_us	-	
Worst Case Response Time us	-	
-	Safe data duration	
-	Additional tolerated packet loss	
-	Node guarding packets	
Additional Parameter	Safe machine options	
Activate Safe Machine Options	Safe machine options - Enable	
General Settings	General settings - Automatic reset on start	
Automatic Reset at Startup	Automatic reset on start - Enable	
Behavior of Functional Fail Safe	General settings - Behavior of Functional Fail Safe (FFS)	
Behavior of Functional Fail Safe	FFS - Mode	
Delay for STO in Functional Fail Safe [µs]	FFS - STO Enable delay time	t _{FFS_STO}
Delay time until the brake engages [μs]	FFS - Delay time until brake engages	t _{FFS_BRAKE}
-	FFS - Caused by encoder error	
-	General settings - Blackout mode	
<u>- </u>	BM - Mode	
-	BM - Delay time to IDLE	
-	BM - Configured safety functions	
Encoder Unit System	General settings - Encoder Unit System (EUS)	
Encoder Type	EUS - Encoder type	
Number of signal periods	EUS - Number of signal periods	
Count of physical reference system	EUS - Count of physical reference system	
Units per count of physical reference system [units]	EUS - Units per count of physical reference system	
Counting direction	EUS - Counting direction	
Length of physical reference system for linear encoder (nm)	EUS - Length of physical reference system for linear encoder	
Maximum speed to normalize the speed range (units/s)	EUS - Maximum speed to normalize speed range	V _{EUS_MAX_NORM}
Maximum acceleration (rad/s² or mm/s²)	EUS - Encoder acceleration limit	a _{EUS ENC L}
_	General settings - Motor	
-	Motor - Number of pole pairs	
-	Motor - Direction	
-	Motor - Stator resistance	
-	Motor - Stator inductance	
-	Motor - Torque constant	k _T
-	Motor - Rated speed	
-	Motor - Stall current	I ₀
-	Motor - Rated current	
-	Motor - Peak current	I _P
-	Motor - Stall torque	T ₀
	Motor - Peak torque	T _P
	Motor - Moment of inertia	'''
-		
-	Motor - External moment of inertia (optional)	
	General settings - SSO	
-	SSO - Speed tolerance safe speed	
-	SSO - Inverter switching frequency	
-	SSO - Inverter adjustment amplification factor	
-	SSO - Inverter adjustment exponent	
-	SSO - External load enabled	
Encoder Monitoring	General settings - Encoder monitoring	
-	Encoder monitoring - Safe Encoder Mounting	
Encoder Position monitoring	Encoder monitoring - Position error monitoring - Enable	
Encoder Speed monitoring	Encoder monitoring - Speed error monitoring - Enable	
Set position alive testing	Encoder monitoring - Position setpoint alive testing (SPA) - Enable	
Encoder Monitoring Tolerances	-	
Encoder Monitoring Polerances		

Table 295: SafeMOTION parameters

Safety technology • SafeMOTION register description

Parameter Previous name	Name in Safety Release 1.10 and later	Formula sym bols
Encoder monitoring Speed tolerance (units/s)	Encoder monitoring - Speed error tolerance	V _{EM_T}
Safety Standstill and Direction Tolerances	General settings - Standstill monitoring	
Speed Tolerance (units/s)	Standstill monitoring - Speed tolerance	V _{SM_T}
Position Tolerance (units)	Standstill monitoring - Position tolerance	S _{SM_T}
Early Limit Monitoring	General settings - Early limit monitoring	
Early Limit Monitoring	Early limit monitoring - Enable	
Early Limit Monitoring time	Early limit monitoring - Time	t _{ELM}
Safety Deceleration Ramp	General settings - Ramp monitoring	
Deceleration Ramp [units/s²]	Ramp monitoring - Speed deceleration limit	a _{RM_L}
Safety Additional Parameters	-	
Delay time to start ramp monitoring (us)	Ramp monitoring - Enable delay time	t _{RM_ED}
General Settings	Basic functions - STO1	
Channel selection for One Channel STO (STO1)	STO1 - Channel	
General Settings	Basic functions - SS1	
Rampmonitoring for SS1	SS1 - Ramp monitoring - Enable	
Safety Ramp Monitoring Times	-	
Ramp Monitoring Time for SS1 (us)	SS1 - Ramp monitoring - Time	t _{SS1_RM}
Safety Additional Parameters	Basic functions - SBC	
Delay time to start SBC (us)	SBC - Enable delay time	t _{SBC_ED}
General Settings	Speed functions - SS2	
Rampmonitoring for SS2	SS2 - Ramp monitoring - Enable	
Safety Ramp Monitoring Times	-	
Ramp Monitoring Time for SS2 (us)	SS2 - Ramp monitoring - Time	t _{SS2_RM}
Safely Limited Acceleration	Speed functions - SLA	
Safe acceleration limit for SLA (units/s²) in positive direction	SLA - Acceleration limit in positive direction	a _{SLA_ACC_P_L}
Safe deceleration limit for SLA (units/s²) in positive direction	SLA - Deceleration limit in positive direction	a _{SLA_DEC_P_L}
Safe acceleration limit for SLA (units/s²) in negative direction	SLA - Acceleration limit in negative direction	a _{SLA_ACC_N_L}
Safe deceleration limit for SLA (units/s²) in negative direction	SLA - Deceleration limit in negative direction	a _{SLA_DEC_N_L}
Safety Additional Parameters	-	
Delay time to start SLA (us)	SLA - Enable delay time	t _{SLA_ED}
General Settings	Speed functions - SMS/SLS	
Safe Maximum Speed	SMS - Enable	
Rampmonitoring for SLS	SLS - Ramp monitoring - Enable	
Safety Speed Limits	-	
Maximum Speed for SMS (units/s)	SMS - Speed limit	V _{SMS_L}
Safe Speedlimit 1 for SLS (units/s)	SLS1 - Speed limit	V _{SLS1_L}
Safe Speedlimit 2 for SLS (units/s)	SLS2 - Speed limit	V _{SLS2_L}
Safe Speedlimit 3 for SLS (units/s)	SLS3 - Speed limit	V _{SLS3_L}
Safe Speedlimit 4 for SLS (units/s)	SLS4 - Speed limit	V _{SLS4_L}
Safety Ramp Monitoring Times	-	
Ramp Monitoring Time for SLS1 (us)	SLS1 - Ramp monitoring - Time	t _{SLS1_RM}
Ramp Monitoring Time for SLS2 (us)	SLS2 - Ramp monitoring - Time	t _{SLS2_RM}
Ramp Monitoring Time for SLS3 (us)	SLS3 - Ramp monitoring - Time	t _{SLS3_RM}
Ramp Monitoring Time for SLS4 (us)	SLS4 - Ramp monitoring - Time	t _{SLS4_RM}
Safety Additional Parameters	Advanced functions - SDI	
Delay time to start SDI (us)	SDI - Enable delay time	t _{SDI_ED}
Safely Limited Increment	Advanced functions - SLI	
Safe Increments (units)	SLI - Position limit	S _{SLI_L}
SLI Off Delay (µs)	SLI - Disable delay time	t _{SLI_DD}
Safe Brake Test	Advanced functions - SBT	
Safe Brake Test threshold (uA)	SBT - Threshold	İ _{SBT_TRESH}
Safe Brake Test external load (uA)	SBT - External load	İ _{SBT_EXT_LOAD}
Safe Brake Test position tolerance (units)	SBT - Position tolerance	S _{SBT_L}
Safe Brake Test maximum torque duration (us)	SBT - Maximum torque duration	t _{SBT_D}
Safe Brake Test interval (s)	SBT - Test interval	t _{SBT_TI}
	Advanced functions - SLT	
-	SLT - Torque limit	T _{SLT_L}
-	SLT - Enable delay time	T _{SLT_ED}
Safety Additional Parameters	-	
Delay Time to start SBT (us)	SBT - Enable delay time	t _{SBT_ED}
Homing	Absolute position functions - Homing	_
Mode	Homing - Mode	
Home Position or Home Offset (units)	Homing - Home position or home offset	S _{HOME}
Remanent Safe Position	Homing - Enable RSP (Remanent safe position)	
Edge of reference switch	Homing - Edge of reference switch	
Trigger direction	Homing - Trigger direction	
Reference pulse	Homing - Enable reference pulse	
Blocking distance (% encoder reference system)	Homing - Blocking distance	
Max. trigger speed (units/s)	Homing - Maximum trigger speed	V _{HOME_MAX}

Table 295: SafeMOTION parameters

Chapter 6 Safety technology

Safety technology • SafeMOTION register description

Parameter						
Previous name	Name in Safety Release 1.10 and later	Formula symbols				
Homing Monitoring Time (µs)	Homing - Monitoring time	t _{HOME_M}				
General Settings	Absolute position functions - SMP/SLP					
Safe Maximum Position	SMP - Enable					
Safety Position Limits	-

Delay time to start SLP (us)	SLP - Enable delay time	t _{SLP_ED}				

Table 295: SafeMOTION parameters

Associated group name

6.4 Channel list For ACOPOSmulti SafeMOTION and ACOPOSmotor SafeMOTION

Channel name	Starting with Safety Release	Access via Automation Studio	Access via SafeDESIGNER	Data type	Description
ModuleOK	R 1.3	Read		BOOL	Indicates if the module is OK
SerialNumber	R 1.3	Read 1)		UDINT	Module serial number
ModuleID	R 1.3	Read 1)		UINT	Module code
HardwareVariant	R 1.3	Read 1)		UINT	Hardware variant
FirmwareVersion	R 1.3	Read 2)		UINT	Module firmware version
UDID low	R 1.3	(Read) 2)	I	UDINT	UDID, lower 4 bytes
UDID high	R 1.3	(Read) 2)		UINT	UDID, upper 2 bytes
SafetyFWversion1	R 1.3	(Read) 2)		UINT	Firmware version of safety processor 1
SafetyFWversion2	R 1.3	(Read) 2)		UINT	Firmware version of safety processor 2
Diag1 Temp	R 1.3	(Read) 2)		UINT	Module temperature in °C
Diag1 24V	R 1.3	(Read) 2)		UINT	Voltage measurement µP1 - 24V
Diag1 3V3	R 1.3	(Read) 2)		UINT	Voltage measurement µP1 - 3V3
Diag1 5V	R 1.3	(Read) 2)		UINT	Voltage measurement µP1 - 5V
Diag2 24V	R 1.3	(Read) 2)		UINT	Voltage measurement µP2 - 24V
Diag2 3V3	R 1.3	(Read) 2)		UINT	Voltage measurement µP2 - 3V3
Diag2_5V	R 1.3	(Read) 2)	 	UINT	Voltage measurement µP2 - 5V
SafeModuleOK	R 1.3	(iteau)	Read	SAFEBOOL	Indicates if the safe communication channel is OK
	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of STO safety function
SafetyActiveSTO			, ,		(TRUE = safe state)
SafetyActiveSBC	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of SBC safety function (TRUE = safe state)
SafetyActiveSOS	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of SOS safety function (TRUE = safe state)
SafetyActiveSS1	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of SS1 safety function (TRUE = safe state)
SafetyActiveSS2	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of SS2 safety function (TRUE = safe state)
SafetyActiveSLS1	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of SLS1 safety function (TRUE = safe state)
SafetyActiveSLS2	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of SLS2 safety function
SafetyActiveSLS3	R 1.3	Read	(Read) 3)	SAFEBOOL	(TRUE = safe state) Status of SLS3 safety function
SafetyActiveSL4	R 1.3	Read	(Read) 3)	SAFEBOOL	(TRUE = safe state) Status of SLS4 safety function
SafetyActiveSTO1	R 1.3	Read	(Read) 3)	SAFEBOOL	(TRUE = safe state) Status of STO1 safety function
SafetyActiveSDIpos	R 1.3	Read	(Read) 3)	SAFEBOOL	(TRUE = safe state) Status of SDIpos safety function
SafetyActiveSLI	R 1.3	Read	(Read) 3)	SAFEBOOL	(TRUE = safe state) Status of SLI safety function
SafetyActiveSDIneg	R 1.3	Read	(Read) 3)	SAFEBOOL	(TRUE = safe state) Status of SDIneg safety function
, ,	R 1.4	Read	, ,	SAFEBOOL	(TRUE = safe state)
SafetyActiveSLP			(Read) 3)		Status of SLP safety function (TRUE = safe state)
SafetyActiveSMP	R 1.4	Read	(Read) 3)	SAFEBOOL	Status of SMP safety function (TRUE = safe state)
SafePositionValid	R 1.4	Read	(Read) 3)	SAFEBOOL	Status of the safe position (TRUE = valid position referencing and no errors found)
SafetyActiveSLA	R 1.9	Read	(Read) 3)	SAFEBOOL	Status of the SLA safety function (TRUE = safe status)
StatusSetPosAlive	R 1.3	Read		SAFEBOOL	Status of position setpoint "Alive Testing" (TRUE = valid)
ReqHomingOK	R 1.9	(Read) 4)	(Read) 3)	SAFEBOOL	Feedback for homing in SafeDESIGNER (TRUE = safe position is valid and request for safe homing is TRUE)
AllReqFuncAct	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of the requested safety functions (TRUE = all requested safety functions are active)
SafetyActiveSDC	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of the delay monitor (TRUE = delay monitoring is active)
Operational	R 1.3	Read		SAFEBOOL	Status of the function block (TRUE = function block is in the state OPERATIONAL, SAFE or WAIT FOR CONFIRMATION)
NotErrENC	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of the safe encoder (FALSE = pending encoder error)
NotErrFUNC	R 1.3	Read	(Read) 3)	SAFEBOOL	Status of the SafeMOTION module (FALSE = SafeMOTION module is in the FUNCTIONAL
ScaledSpeed	R 1.3	Read	(Read) 3)	SAFEINT	FAIL SAFE error state) Safe scaled speed
			, ,		·
SafePos Safety Active SBT	R 1.4	Read	(Read) 3)	SAFEDINT	Safe position
SafetyActiveSBT	R 1.7	Read	(Read) 3)	SAFEBOOL	SBT Active bit (TRUE = active)
SafetyStatusSBT	R 1.7	Read	(Read) 3)	SAFEBOOL	SBT Status bit (TRUE = valid)

Table 296: SafeMOTION channel list for ACOPOSmulti SafeMOTION and ACOPOSmotor SafeMOTION

Safety technology • SafeMOTION register description

Channel name	Starting with Safety Release	Access via Automation Studio	Access via SafeDESIGNER	Data type	Description
RSPValid	R 1.9	Read	(Read) 3)	SAFEBOOL	Remanent safe position is validated and saved (TRUE = safe position is saved, Power Off for homing with RSP is possible)
RequestSTO	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the STO safety function
RequestSBC	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SBC safety function
RequestSOS	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SOS safety function
RequestSS1	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SS1 safety function
RequestSS2	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SS2 safety function
RequestSLS1	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SLS1 safety function
RequestSLS2	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SLS2 safety function
RequestSLS3	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SLS3 safety function
RequestSLS4	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SLS4 safety function
RequestSTO1	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the STO1 safety function
RequestSDIpos	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SDIpos safety function
RequestSLI	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SLI safety function
RequestSDIneg	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SDIneg safety function
RequestSLP	R 1.4	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SLP safety function
RequestHoming	R 1.4	(Read) 4)	(Write) 5)	SAFEBOOL	Requests safe homing
ReferenceSwitch	R 1.4	(Read) 4)	(Write) 5)	SAFEBOOL	Safe input for using a reference switch
RequestSBT	R 1.7	(Read) 4)	(Write) 5)	SAFEBOOL	SBT control bit
RequestSLA	R 1.9	(Read) 4)	(Write) 5)	SAFEBOOL	Selects/Deselects the SLA safety function
SwitchHomingMode	R 1.9	(Read) 4)	(Write) 5)	SAFEBOOL	Activates homing with RSP (TRUE = RSP homing mode is active)
Activate	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Enables the function block
Reset	R 1.3	(Read) 4)	(Write) 5)	SAFEBOOL	Reset input to acknowledge the FUNCTIONAL FAIL SAFE state

Table 296: SafeMOTION channel list for ACOPOSmulti SafeMOTION and ACOPOSmotor SafeMOTION

- 1) Channel only visible if parameter "Module Information" has been set to "on".
- 2) This data is accessed in Automation Studio using the ASIOACC library.
- 3) This data is accessed indirectly via the outputs of the function blocks SF_SafeMC_BR, SF_SafeMC_BR_V2, SF_SafeMC_Speed_BR, SF_SafeMC_Position_BR or SF_SafeMC_Position_BR_V2.
- 4) This data can be accessed via NC Action or Trace.
- 5) This data is accessed indirectly via the inputs of the function blocks SF_SafeMC_BR, SF_SafeMC_BR_V2 or SF_SafeMC_BR_V3.

6.5 Channel list For ACOPOS P3 SafeMOTION

Channel name	Starting with Safety Release		Access via SafeDESIGNER	Data type	Description
ModuleOK	R 1.10	Read		BOOL	Indicates if the module is OK
SerialNumber	R 1.10	Read ¹⁾		UDINT	Module serial number
ModuleID	R 1.10	Read ¹⁾		UINT	Module code
HardwareVariant	R 1.10	Read ¹⁾		UINT	Hardware variant
FirmwareVersion	R 1.10	Read ²⁾		UINT	Module firmware version
UDID_low	R 1.10	(Read) ²⁾		UDINT	UDID, lower 4 bytes
UDID_high	R 1.10	(Read) ²⁾		UINT	UDID, upper 2 bytes
SafetyFWversion1	R 1.10	(Read) ²⁾		UINT	Firmware version of safety processor 1
SafetyFWversion2	R 1.10	(Read) ²⁾		UINT	Firmware version of safety processor 2
SCError	R 1.10	(Read) ²⁾		USINT	Error in safety communication
SCErrorQuit	R 1.10	(Read) ²⁾		UINT	Error in safety communication
SCErrorEnable	R 1.10	(Read) ²⁾		UINT	Error in safety communication
Diag1_Temp	R 1.10	(Read) ²⁾	 	INT	Module temperature in °C
Diag2_24V	R 1.10	(Read) ²⁾ (Read) ²⁾		UINT	Voltage measurement µP2 - 24V Voltage measurement µP2 - 3V3
Diag2_3V3	R 1.10	(Read) ²⁾		UINT	Voltage measurement µP2 - 5V
Diag2_5V SafeModuleOK	R 1.10	(Reau)=/	Read	SAFEBOOL	Indicates if the safe communication channel is OK
For ACOPOS P3 SafeMOTION 1-a.				SAFEBOOL	indicates if the sale communication channel is OK
AX1_StatusNotErrorFunc	R 1.10	Read	(Read) ³⁾	SAFEBOOL	FUNCTIONAL FAIL SAFE status bit (FALSE = functional error) for axis 1
AX1 StatusOperational	R 1.10	Read	(Read)3)	SAFEBOOL	Function block axis 1 is in state OPERATIONAL.
AX1_StatusSTO	R 1.10	Read	(Read) ³⁾	SAFEBOOL	STO status bit (TRUE = active)
AX1_StatusSBC	R 1.10	Read	(Read) ³⁾	SAFEBOOL	SBC status bit (TRUE = active)
AX1_StatusSS1	R 1.10	Read	(Read) ³)	SAFEBOOL	SS1 status bit (TRUE = active)
AX1 StatusNotErrorEnc	R 1.10	Read	(Read) ³⁾	SAFEBOOL	Encoder error status bit (FALSE = encoder error)
AX1_StatusSTO1	R 1.10	Read	(Read) ³⁾	SAFEBOOL	STO1 status bit (TRUE = active)
AX1 StatusSDC	R 1.10	Read	(Read) ³⁾	SAFEBOOL	SDC status bit (TRUE = active)
AX1 StatusSOS	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SOS status bit (TRUE = active)
AX1 StatusSS2	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SS2 status bit (TRUE = active)
AX1 StatusSLA	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLA status bit (TRUE = active)
AX1 StatusSLS1	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS1 status bit (TRUE = active)
AX1 StatusSLS2	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS2 status bit (TRUE = active)
AX1 StatusSLS3	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS3 status bit (TRUE = active)
AX1 StatusSLS4	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS4 status bit (TRUE = active)
AX1 StatusSDI Pos	R 1.10	Read	(Read) ⁵⁾	SAFEBOOL	SDI pos status bit (TRUE = active)
AX1 StatusSDI Neg	R 1.10	Read	(Read) ⁵⁾	SAFEBOOL	SDI neg status bit (TRUE = active)
AX1 StatusSLI	R 1.10	Read	(Read) ⁵⁾	SAFEBOOL	SLI status bit (TRUE = active)
Ax1 StatusSBTValid	R1.10	Read	(Read) ⁵⁾	SAFEBOOL	SBT Status bit (TRUE = Valid)
Ax1_StatusSBT	R1.10	Read	(Read) ⁵⁾	SAFEBOOL	SBT Active bit (TRUE = Active)
AX1 StatusSLT	R1.10	Read	(Read) ⁵⁾	SAFEBOOL	STL status bit (TRUE = Active)
AX1_StatusAllReqActive	R 1.10	Read	(Read) ⁵⁾	SAFEBOOL	All requested safety functions are active
AX1_StatusHoming	R 1.10	Read	(Read) ⁶⁾	SAFEBOOL	Safe position valid bit (TRUE = valid)
AX1_StatusRequestHomingOK	R 1.10	Read	(Read)6)	SAFEBOOL	Status of the request for safe homing
AX1_StatusSLP	R 1.10	Read	(Read)6)	SAFEBOOL	SLP status bit (TRUE = active)
AX1_StatusSMP	R 1.10	Read	(Read) ⁶⁾	SAFEBOOL	SMP status bit (TRUE = active)
AX1_StatusRSPValid	R 1.10	Read	(Read)6)	SAFEBOOL	RSP Valid Bit
AX1_StatusSetPosAlive	R 1.10	Read	(Read) ⁶⁾	SAFEBOOL	"Alive testing" of position setpoint is valid.
AX1_SafePOSITION_4Byte	R 1.10	Read	(Read)8)	SAFEBOOL	Safe position
AX1_ScaledSafeSPEED_2Byte	R 1.10	Read	(Read) ⁷⁾	SAFEBOOL	Scaled safe speed
Only for ACOPOS P3 SafeMOTION	V 2-axis and 3-a	xis modules			
AX2_StatusNotErrorFunc	R 1.10	Read	(Read) ³⁾	SAFEBOOL	FUNCTIONAL FAIL SAFE status bit (FALSE = functional error) for axis 2
AX2_StatusOperational	R 1.10	Read	(Read)3)	SAFEBOOL	Function block axis 2 is in state OPERATIONAL.
AX2_StatusSTO	R 1.10	Read	(Read)3)	SAFEBOOL	STO status bit (TRUE = active)
AX2_StatusSBC	R 1.10	Read	(Read)3)	SAFEBOOL	SBC status bit (TRUE = active)
AX2_StatusSS1	R 1.10	Read	(Read)3)	SAFEBOOL	SS1 status bit (TRUE = active)
AX2_StatusNotErrorEnc	R 1.10	Read	(Read)3)	SAFEBOOL	Encoder error status bit (FALSE = encoder error)
AX2_StatusSTO1	R 1.10	Read	(Read)3)	SAFEBOOL	STO1 status bit (TRUE = active)
AX2_StatusSDC	R 1.10	Read	(Read)3)	SAFEBOOL	SDC status bit (TRUE = active)
AX2_StatusSOS	R 1.10	Read	(Read)4)	SAFEBOOL	SOS status bit (TRUE = active)
AX2_StatusSS2	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SS2 status bit (TRUE = active)
AX2_StatusSLA	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLA status bit (TRUE = active)
AX2_StatusSLS1	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS1 status bit (TRUE = active)
AX2_StatusSLS2	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS2 status bit (TRUE = active)
AX2_StatusSLS3	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS3 status bit (TRUE = active)
AX2_StatusSLS4	R 1.10	Read	(Read) ⁴⁾	SAFEBOOL	SLS4 status bit (TRUE = active)
AX2 StatusSDI Pos	R 1.10	Read	(Read) ⁵⁾	SAFEBOOL	SDI pos status bit (TRUE = active)

Table 297: SafeMOTION channel list for ACOPOS P3 SafeMOTION

- 3) 4)
- This data is accessed in Automation Studio using library ASIGACO.

 This data is accessed indirectly via the inputs/outputs of function block SF_oS_MOTION_Basic_BR or SF_oS_MOTION_BR.

 This data is accessed indirectly via the inputs/outputs of function block SF_oS_MOTION_Speed_BR or SF_oS_MOTION_BR.

 This data is accessed indirectly via the inputs/outputs of function block SF_oS_MOTION_Advanced_BR or SF_oS_MOTION_BR.
- This data is accessed indirectly via the inputs/outputs of function block SF_oS_MOTION_AbsPos_BR or SF_oS_MOTION_BR.
- This data is accessed indirectly via the inputs/outputs of function block SF_oS_MOTION_ScaledSpeed_BR or SF_oS_MOTION_BR. This data is accessed indirectly via the inputs/outputs of function block SF_oS_MOTION_Position_BR or SF_oS_MOTION_BR. 7)
- This data can only be accessed via NC Action or Trace.

7 Configuring the safety functions

The concept of integrated safety technology is based on keeping all functional control in the inverter unit, with the SafeMOTION module dedicated to monitoring configurable limits.

The only exception is that the SafeMOTION module activates safe pulse disabling and the safe motor holding brake.

The standard application must react accordingly to the request for a safety function.

To ensure proper interaction between the standard and the safety application (and thereby ensuring maximum availability of the system), the different timing of the two applications must be taken into account.

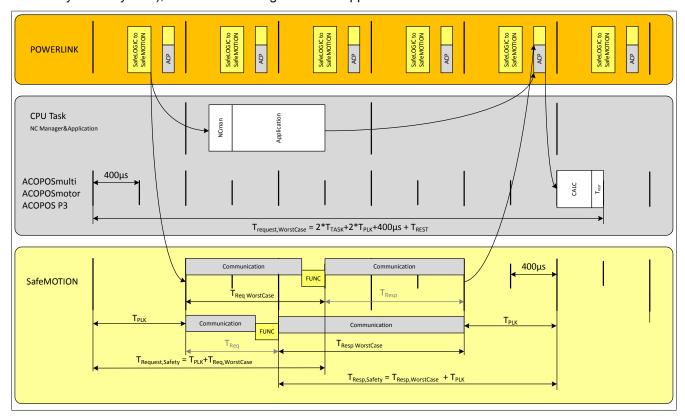

Figure 94: Inverter unit timing - SafeMOTION module

Delay time	ACOPOSmulti SafeMOTION	ACOPOS P3 SafeMOTION
Request control bits (T _{ReqWorstCase})	1200 µs	1250 µs
Response status bits (T _{RespWorstCase})	1600 μs	1550 µs

Table 298: SafeMOTION module - Delay time

The differing runtimes of the standard and the safety application can be taken into account with the "Delay times for requesting a safety function".

Parameter	Unit	Description	Default value
Delay time to start ramp moni-	[µs]	Delay time between the request for ramp-based monitoring and the start of mon-	0
toring (us)		itoring	
Delay time to start SDI (us)	[µs]	Delay time between the SDI request and activation of the safety function	0
Delay time to start SBC (us)	[µs]	Delay time between the SBC request and activation of the safety function	0
Delay time to start SLP (us) 1)	[µs]	Delay time between the SLP request and start of monitoring	0
Delay Time to start SBT (us) 2)	[µs]	Delay time between the SBT request and activation of the safety function	0
Delay Time to start SLA (us) 3)	[µs]	Delay time between the SLA request and activation of the safety function	0

Table 299: Delay times for requesting a safety function

- 1) Only available with Safety Release 1.4 or later!
- 2) Only available with Safety Release 1.7 or later and only for ACOPOSmulti SafeMOTION SinCos!
- 3) Only available with Safety Release 1.9 or later!

7.1 SafeMOTION Help Tool

The SafeMOTION Help Tool assists in the development of SafeMOTION projects. This program can be used to make calculations that are required frequently.

Starting with V6.0 of the SafeMOTION Help Tool, two variants of the SafeMOTION Help Tool are available:

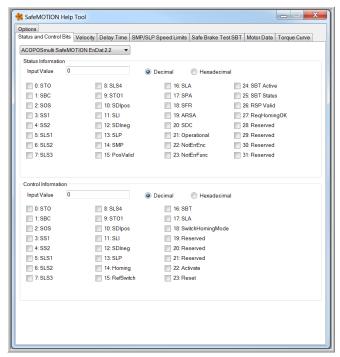

- · mapp Safety
- Legacy safety

The variant can be changed under 7.1.8 ""Options" tab" on page 470 tab "Options".

Information:

The parameters can be limited to different maximum values. If an impermissible value is entered, section *Invalid input* in the SafeDESIGNER parameters must be read.

7.1.1 "Status and control bits" tab

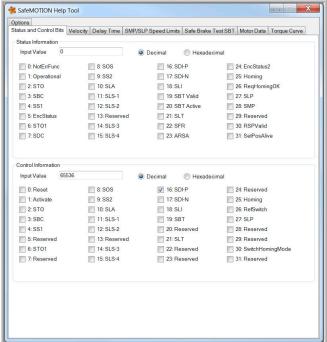

Figure 95: SafeMOTION Help Tool - Tab "Status and control bits" (legacy safety)

Figure 96: SafeMOTION Help Tool - Tab "Status and control bits" (mapp Safety)

"Status Information" section

Information:

Status information can be determined by running a trace on the cyclic data (ParID 4).

Showing status bits for the status information that has been determined

- 1. Specify whether the value that has been determined for the status information is decimal or hexadecimal.
- 2. Enter the value that has been determined in the *Input value* field.
 - → The checkboxes now show the status bits for the determined status information.

Determining the input value for a combination of status bits

1. Specify whether the input value should be displayed as a decimal or hexadecimal value.

- 2. Set the desired combination of status bits by selecting the checkboxes.
 - → The input value that corresponds with the combination of status bits is shown.

"Control Information" section

Information:

Control information can be determined by running a trace on the cyclic data (ParID 5).

Showing status bits for the control information that has been determined

- 1. Specify whether the value that has been determined for the control information is decimal or hexadecimal.
- 2. Enter the value that has been determined in the *Input value* field.
 - → The check boxes now show the control bits for the determined control information.

Determining the input value for a combination of control bits

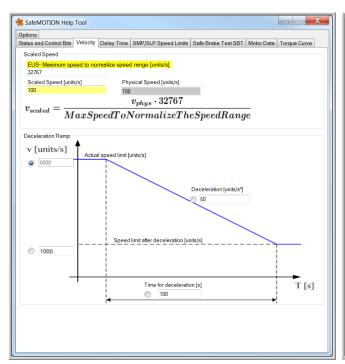

- 1. Specify whether the input value should be displayed as a decimal or hexadecimal value.
- 2. Set the desired combination of control bits by selecting the check boxes.
 - → The input value that corresponds with the combination of control bits is shown.

Information:

Selecting the SafeMOTION module displays the corresponding status and control bits. This only applies to "legacy safety"; there is no distinction in mapp Safety.

7.1.2 "Velocity" tab

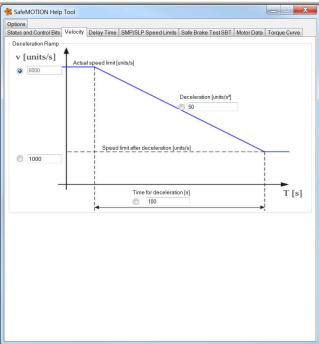

Figure 97: SafeMOTION Help Tool
- Tab "Velocity" (legacy safety)

Figure 98: SafeMOTION Help Tool
- Tab "Velocity" (mapp Safety)

"Scaled Speed" section

In section *Scaled speed*, a scaled speed can be converted to a physical speed [units/s] and back again based on the "Maximum speed to normalize the speed range [units/s]" value.

Parameter names marked in yellow correspond to parameters in SafeDESIGNER.

Scaled → physical speed conversion

- 1. Enter the value for "Maximum speed to normalize the speed range [units/s]".
- 2. Enter the value for the scaled speed [units/s].
 - → The respective value for the physical speed [units/s] is shown.

Physical → scaled speed conversion

- 1. Enter the value for "Maximum speed to normalize the speed range [units/s]".
- 2. Enter the value for the physical speed [units/s].
 - → The respective value for the scaled speed [units/s] is shown.

"Deceleration Ramp" section

In section *Deceleration Ramp*, three parameters are used to calculate a fourth parameter in order to define a deceleration ramp. Which parameter to be determined can be freely selected.

Procedure

- 1. Choose the parameter to determine:
 - Current speed limit [units/s]
 - ° Delay [units/s]
 - Speed limit after the delay [units/s]
 - ° Delay time [s]
- 2. Enter the values for the three remaining parameters in their respective fields.
 - → The calculated value for the fourth parameter is displayed.

7.1.3 "Delay Time" tab

This tab can be used to calculate the delay time to be set on the SafeMOTION module (e.g. "Delay time to start ramp monitoring"), see "Inverter unit timing - SafeMOTION module" on page 459. The delay time is the difference between the times $T_{Request, Safety}$ and $T_{Request, WorstCase}$.

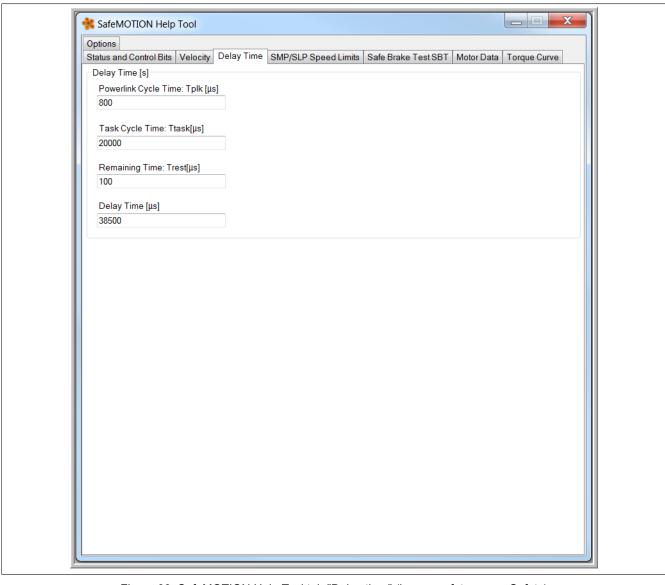

Figure 99: SafeMOTION Help Tool tab "Delay time" (legacy safety, mapp Safety)

"Delay Time" section

Procedure

- 1. Enter value for the POWERLINK cycle time [µs].
- 2. Enter value for the task cycle time [µs].
- 3. Enter value for the remaining time [µs].
 - → The value calculated for the delay time [µs] is displayed.

7.1.4 "SMP/SLP Speed Limits" tab

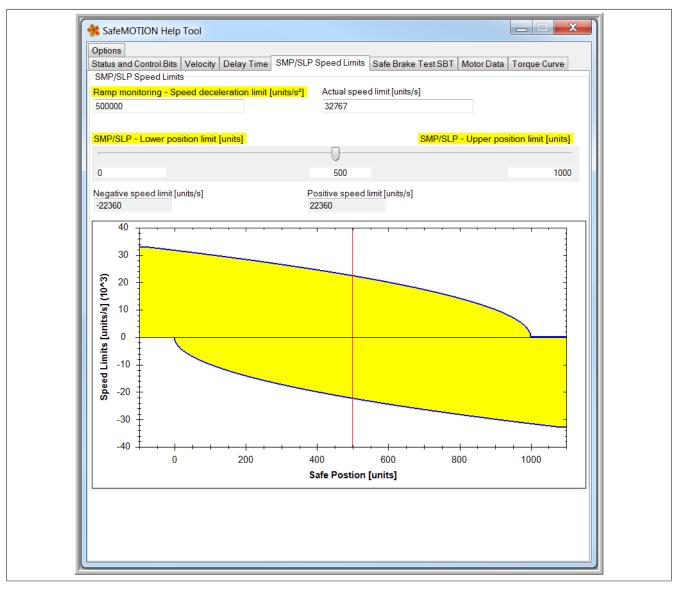

Figure 100: SafeMOTION Help Tool tab "SMP/SLP speed limits" (legacy safety, mapp Safety)

SMP/SLP Speed Limits section

In section *SMP/SLP speed limits*, parameters "Deceleration Ramp [units/s²]" and "Actual speed limit [units/s]" are used to determine the negative and positive speed limit and display them in a diagram.

The "Safe Lower Position Limit for SMP/SLP [units]" and the "Safe Upper Position Limit for SMP/SLP [units]" values can be preset. When a value between these limits is entered, the corresponding values for the negative and positive speed limit [units/s] are determined and displayed.

Parameter names marked in yellow correspond to parameters in SafeDESIGNER.

Calculating negative and positive speed limits

- 1. Enter the value for "Deceleration Ramp [units/s²]".
- 2. Enter the value for "Actual speed limit [units/s]".
- Preset the values for "Safe Lower Position Limit for SMP/SLP [units]" and the "Safe Upper Position Limit for SMP/SLP [units]".
- 4. Enter a value between the limits or move the arrow with the left mouse button

 This value is shown in the diagram as a red vertical line. The red line can be scrolled or shifted using the arrow pointer.
 - \rightarrow The corresponding values for the negative and positive speed limit [units/s] are displayed in the fields and in the diagram.

Diagram

The following diagram illustrates the speed limit [units/s] in relation to the safe position [units].

Displaying and using the diagram

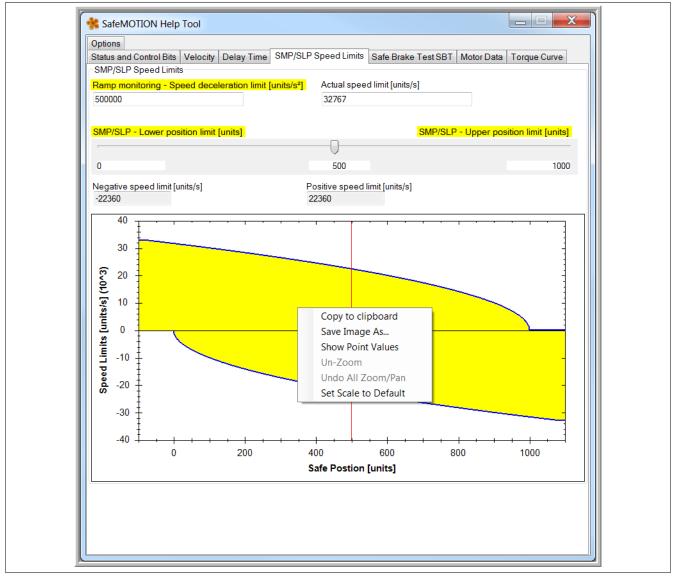

Figure 101: Display diagram with the selection menu (legacy safety, mapp Safety)

Move the mouse pointer over the diagram.

→ A cross-hair pointer appears.

Holding the left mouse button and marking a section zooms in the diagram.

Scrolling with the mouse also zooms in the diagram.

Right-click inside the diagram.

 \rightarrow A selection menu appears.

Select a menu item with the left mouse button.

 Save image as...
 Saves the image

 Show point values
 Displays the values of individual points when moving the cross-hair pointer over the line in the diagram

 Undo last zoom action
 Reverts back to the previous zoom setting

 Undo all zoom/pan actions
 Resets all zoom/pan actions

 Set scale to default value
 Sets scaling to the default values

7.1.5 "Safe Brake Test SBT" tab

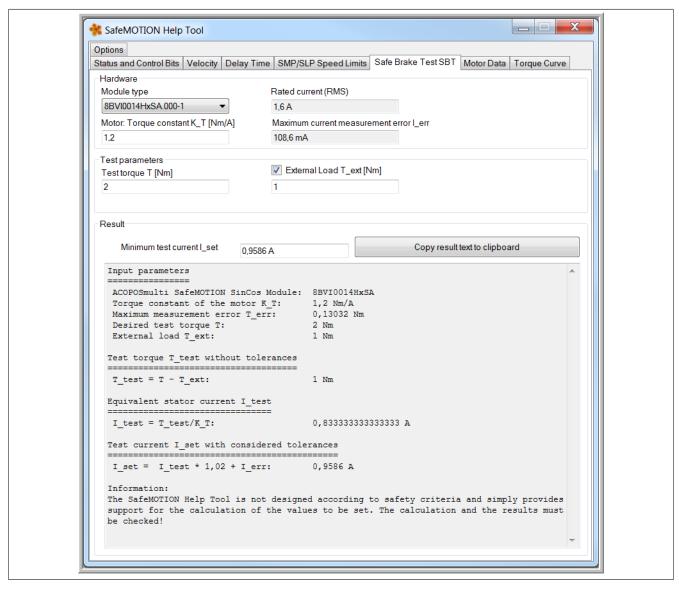

Figure 102: SafeMOTION Help Tool tab "Safe Brake Test SBT" (legacy safety, mapp Safety)

The SafeMOTION Help Tool offers support for calculating the minimum required test torque for ACOPOSmulti SafeMOTION SinCos inverter modules, which is calculated taking into account the drive parameters, the *external load* T_{ext} and measurement imprecision.

The calculation is performed as described in the user's manual under ACOPOSmulti SafeMOTION / Safety technology / Integrated safety functions / Safe Brake Test (SBT).

"Hardware" section

The ACOPOSmulti SafeMOTION SinCos inverter module being used can be set in section "Hardware". This setting is necessary since parameter "*Maximum current measurement error* (I_{err})" depends on the performance class.

The torque constant (K_T) of the motor must also be set; this can be taken from the data sheet for the motor. The SafeMOTION Help Tool outputs parameter "*Maximum current measurement error* (I_{err}) " for the ACOPOSmulti SafeMOTION SinCos inverter module being used.

"Test Parameters" section

The parameters for the "Safe Brake Test (SBT)" are set in this section. It is possible to select whether an "External Load (T_{ext})" should be taken into account. The input values depend on the currently configured performance class. If an invalid value is entered, the respective limit value is shown.

"Result" section

The result of the calculation is the "Minimum test current (I_{set})", which needs to be set while taking the External Load (T_{ext}) and measurement imprecision into account.

If an invalid value is entered, then the respective limit value is output in the *Hardware* section and the results are not calculated.

The text of the results can be copied directly to the clipboard.

Information:

The SafeMC Help Tool is not designed according to strict safety criteria. It simply provides support for calculating the values to be set. The calculation and its results must be checked!

7.1.6 Tab "Motor data"

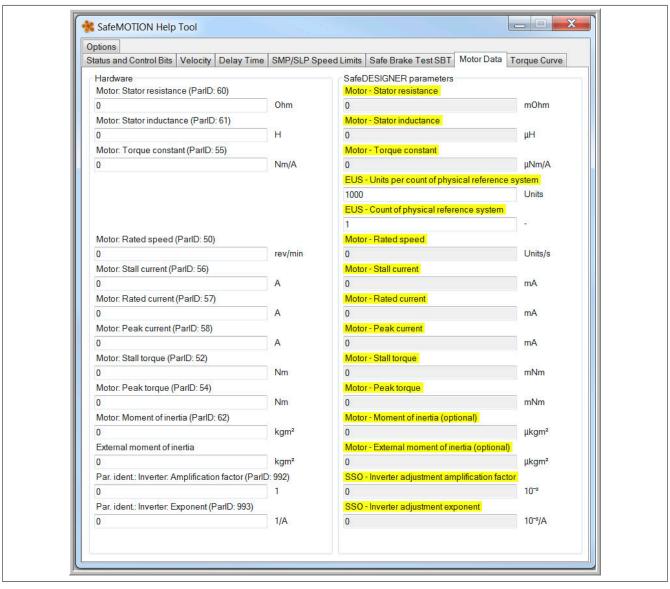

Figure 103: SafeMOTION Help Tool tab "Safe Speed Observer SSO" (legacy safety, mapp Safety)

The SafeMOTION Help Tool provides support for rescaling the parameters of ACOPOS P3 SafeMOTION servo drives to the SafeDESIGNER unit system.

"Hardware" section

In section "Hardware", the required parameters can be entered in the original units (i.e. in the units specified in the motor data sheets or in the units included with the read-out parameter IDs).

As soon as a parameter is entered, it is immediately converted into the SafeDESIGNER unit system.

In addition to the respective parameter designation, the corresponding parameter ID, to which the parameter can be read out, is shown in brackets.

"SafeDESIGNER parameters" section

The yellow parameter names in section "SafeDESIGNER parameters" correspond to the parameters converted into the correct system of units, which are then entered in SafeDESIGNER.

7.1.7 Tab "Torque characteristic"

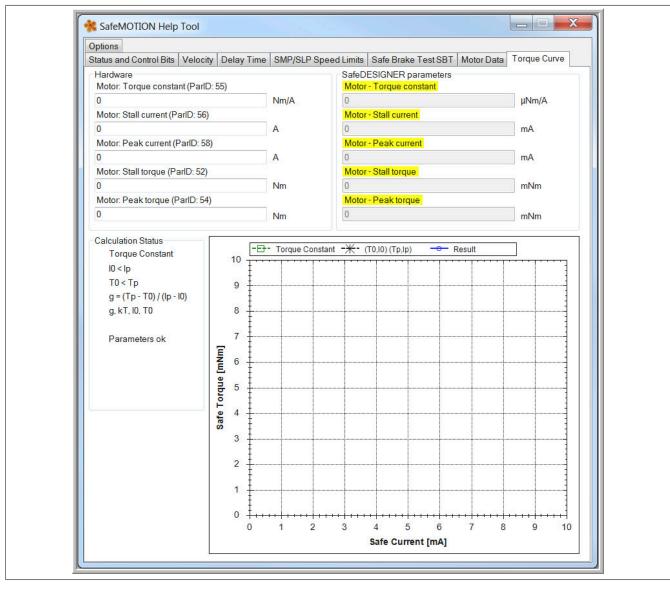

Figure 104: SafeMOTION Help Tool tab "Torque characteristic" (legacy safety, mapp Safety)

"Hardware" section

In section "Hardware", the required parameters can be entered in the original units (i.e. in the units specified in the motor data sheets or in the units included with the read-out parameter IDs). As soon as a parameter is entered, it is immediately converted into the SafeDESIGNER system of units.

Section "SafeDESIGNER parameters"

The yellow parameter names in section "SafeDESIGNER parameters" correspond to the parameters converted into the correct system of units, which are then entered in SafeDESIGNER.

Section "Calculation status"

The parameters entered here are used to check whether they are valid and result in an intersection point. These checks are also performed in the firmware. In addition, the intersection point of the two lines is specified if all parameter entries are correct.

7.1.8 "Options" tab

Section "SafeMOTION"

Variant selection mapp Safety or legacy safety

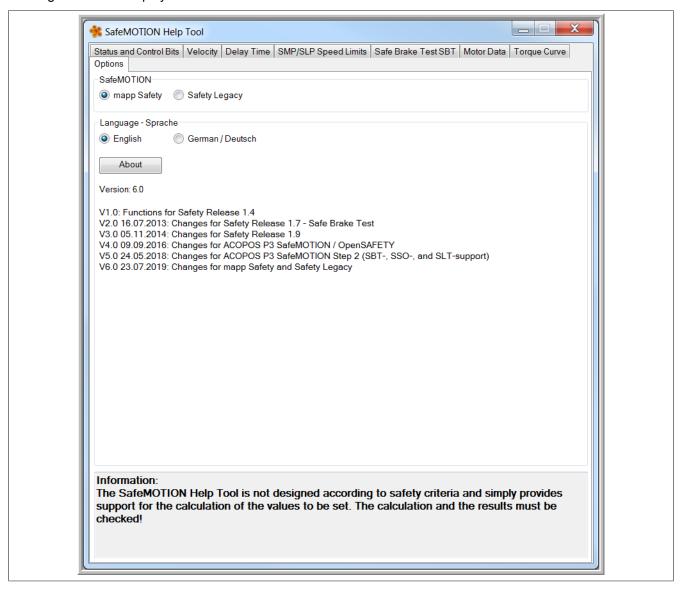

Here, the tool can be repositioned according to the SafeMOTION variant currently being used. This allows it to cover the corresponding available functionalities.

"Language" section

Select English or German.

"About" button

Clicking on "About" displays information about the manufacturer.

7.2 The application in SafeDESIGNER

The safety application is implemented in SafeDESIGNER.

Library PLCopen_Motion_SF_2

The following function blocks in library PLCopen_Motion_SF_2 are available for controlling ACOPOSmulti SafeMOTION inverter modules and ACOPOSmotor SafeMOTION modules:

Function block	Safety Release
SF_SafeMC_BR	Safety Release 1.3 or later
SF_SafeMC_Speed_BR	
SF_SafeMC_BR_V2	Safety Release 1.4 or later
SF_SafeMC_Position_BR	
SF_SafeMC_SBT_BR	Safety Release 1.7 or later
SF_SafeMC_BR_V3	Safety Release 1.9 or later
SF_SafeMC_Position_BR_V2	

Table 300: Function blocks in library PLCopen_Motion_SF_2

For information about using these function blocks as well as the underlying safety functions and associated safe parameters, see 7 "PLCopen Motion SF 2" on page 488.

Library openSAFETY_BuR_Motion_SF

ACOPOS P3 SafeMOTION servo drives support the openSAFETY Safe Motion profile. For this reason, the function blocks in library openSAFETY BuR Motion SF must be used to control the safety functions.

Function block	Safety Release
SF_oS_MOTION_Basic_BR	Safety Release 1.10 and later:
SF_oS_MOTION_Speed_BR	
SF_oS_MOTION_Advanced_BR	
SF_oS_MOTION_AbsPos_BR	
SF_oS_MOTION_BR	
SF_oS_MOTION_ScaledSpeed_BR	
SF_oS_MOTION_Position_BR	

Table 301: Function blocks in library openSAFETY BuR Motion SF

For information about using these function blocks as well as the underlying safety functions and associated safe parameters, see 8 "openSAFETY BuR Motion SF" on page 727.

Danger!

Safety applications are only permitted to be created by qualified personnel. The respective processes specified in the standards must be followed!

The information provided in the "Integrated safety" user's manual (MASAFETY-ENG) under <u>SafeDESIGNER</u> must also be taken into consideration.

Danger!

All of the safety functions that are being used must be tested.

A function is considered to be "in use" if the corresponding input is connected or the safety function has been configured!

7.3 Accessing data on the SafeMOTION module from Automation Studio

There are three ways to access safety-related data from a safe axis in Automation Studio.

7.3.1 I/O mapping

The states of individual safety functions can be accessed via the I/O mapping window for the respective SafeMOTION module. This information is provided in the form of status bits.

To connect PVs to the status bits, the "I/O mapping" window must be opened. As can be seen in the following image, the PV can then be selected in the "PV or channel name" column.

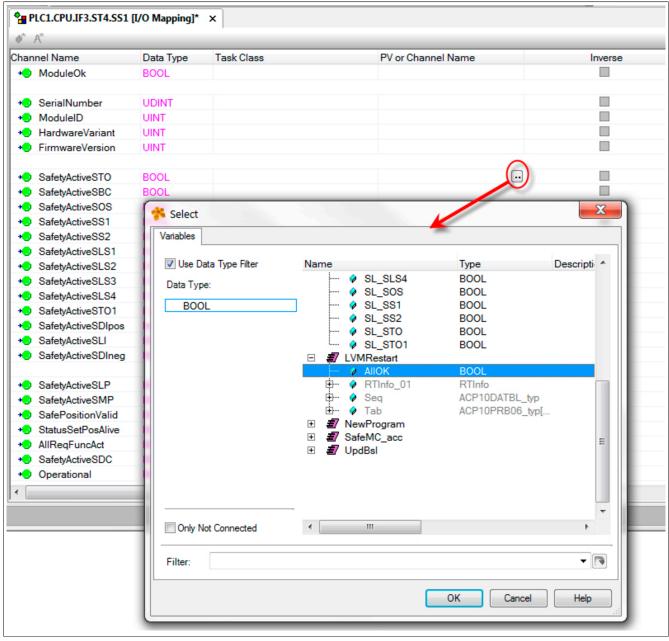

Figure 105: PV mapping

7.3.2 ACOPOS parameter ID

The following parameter IDs are available to make SafeMOTION data available to the non-safety-related part of the ACOPOSmulti SafeMOTION inverter module, ACOPOS P3 SafeMOTION servo drive and ACOPOSmotor SafeMOTION.

ParID	Data type	NC constant (Define)	Description
4	UDINT	SAFEMC_STATUS	Status bits
5	UDINT	SAFEMC_CONTROL	Control bits
6	INT	SAFEMC_SPEED_ACT	Actual speed [scaled units/s]
7	INT	SAFEMC_SPEED_LIM	Speed limit value [scaled units/s], currently monitored speed limit
309	DINT	SAFEMC_POS_ACT	Safe position [units]

Table 302: ACOPOS parameter ID for SafeMOTION

With these Par IDs, you can use all the familiar features of the SafeMOTION module (e.g. NC Trace, reading parameters via service channel, SPT function block connections, etc.).

NC Trace can be used, for example, to optimize how the standard application handles approaching speed limit values. This also provides an easy way of checking whether the values configured for "Delay times for requesting a safety function" are correct or sufficient.

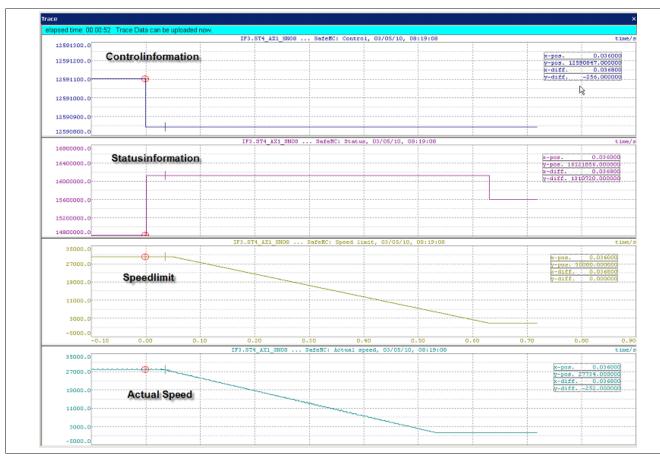

Figure 106: NC Trace: Example with SafeMOTION data

SafeMOTION User's Manual V 4.6.1

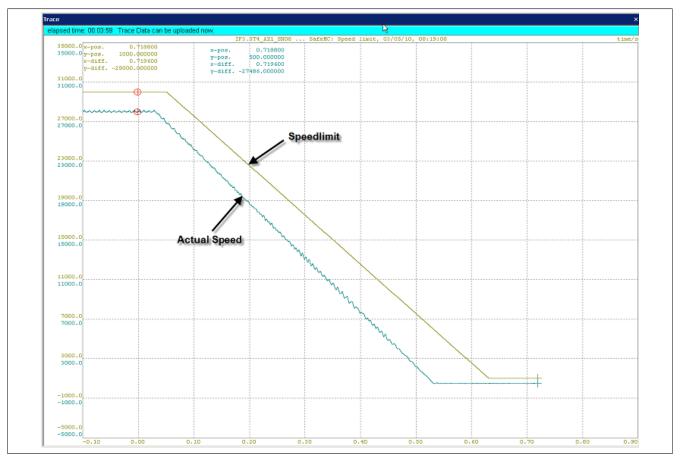

Figure 107: NC Trace: Speed reserve

The parameter IDs "4 status bits" and "5 control bits" are bit-coded, with only the lower three bytes actually relevant. The following tables indicate the bit assignments:

Table 310: Control bits - Byte 3

7.3.3 SafeMC library

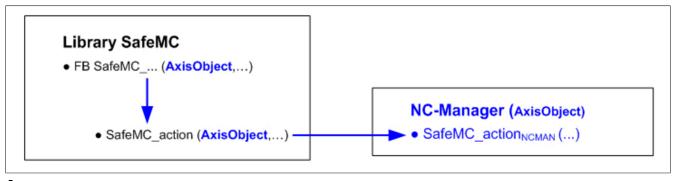

If SafeMOTION modules are being used, it is sometimes necessary to be able to read SafeMOTION data for an axis:

- Safe OUT: Data from the SafeLOGIC (SL) controller to the SafeMOTION module
- Safe IN: Data from the SafeMOTION module to the SafeLOGIC (SL) controller

For **Safe IN** data, it would be possible in the I/O configuration to define PVs to which the data would then be copied cyclically. However, this data must be explicitly assigned to specific axes by the user.

Automation Studio does not include a mechanism for read access to Safe OUT data.

The **SafeMC_action()** function in the SafeMC library makes it possible to access the SafeMOTION data of an axis (described below). The SafeMOTION function blocks call the global **SafeMC_action()** function. Using the specified axis object, **SafeMC_action()** calls a **SafeMC_action_{NCMAN}()** function that is included in the NC Manager belonging to this NC object.

Information:

The SafeMC_action() function only contains a call frame. The actual functionality is part of the corresponding NC Manager function.

For this reason, the constants and data types for the functionalities implemented for the SafeMC_action() function are not included in the SafeMC library:

- Constants are included in library NcGlobal.
- Data types are included in library Acp10man.

7.3.3.1 Function SafeMC_action(): Perform SafeMOTION action

status = SafeMC_action(nc_object, action, par_ptr, par_size)			
Input parameters:			
nc_object	nc_object UDINT NC object		
action	UDINT	UDINT Action to be executed	
par_ptr	UDINT	Address of the parameter data	
par_size	UDINT	JDINT Size of the parameter data in bytes	
Output parameters:			
status	UINT	ncOK or error code	

Table 311: SafeMC_action()

Error codes (also used for function blocks SafeMC_ReadSafeOutData(2)) and SafeMC_ReadSafeInData(2)):

10720	Invalid function pointer:				
	Error during NC software initialization (see Logger)				
	The NC Manager version on the PLC does not yet contain the SafeMC_action() function.				
10721	Invalid NC object (parameter: "nc_object")				
10723	The action (parameter "action") is not defined or not permitted for this NC object.				
10724	Invalid NC object type				
10726	This action is not allowed since the corresponding initializations are not yet complete.				
10729	Parameter "par_ptr" is zero.				
10731	Invalid NC object data (is a PV being used as an NC object for which an INIT value is defined in the variable declaration?)				
10732	Parameter "par_size" is not valid for this action.				
10733	The network status is not valid for this action.				
10734	Invalid network type (the NC object does not belong to a module on the POWERLINK network)				
10735	Invalid length of corresponding network data				
10736	The type of network data is not compatible with "action":				
	SafeOUT/IN data compatible with "action =DATA"				
	SafeOUT/IN data 2 compatible with "action =DATA2"				

In addition, the following error codes are output for some actions, which suggests an initialization error in the SafeMOTION data:

10712	NC object not enabled (channel number too high or no PDO data defined)
20918	"data_len" provided by plAction(plACTION_GET_DP_INFO) too large
20953	"direction_id" provided by plAction(plACTION_GET_DP_INFO) invalid

All other error codes are provided by the functions in the "Powerlnk" library. The following error code deserves special mention:

20923	Data point not available (not entered in the PDO mapping)

7.3.3.2 Accessing SafeMOTION data with the SafeMC_action() function

7.3.3.2.1 READ_SAFEOUT_DATA: Read SafeOUT data

Information:

Function READ_SAFEOUT_DATA and associated data type ACP10SAFEOUTDAT_typ are only available for ACOPOSmulti SafeMOTION inverter modules (EnDat 2.2 and SinCos) and ACOPOSmotor SafeMOTION EnDat 2.2.

Parameter:

ACP10SAFEOUTDAT_typ safeout_data;

Function call:

```
SafeMC_action(ax_obj,SafeMC_action_READ_SAFEOUT_DATA,
&safeout_data,sizeof(safeout_data));
```

Condition(s):

p_ax_dat->network.init == ncTRUE

ACP10SAFEOUTDAT_typ data structure (also used for function block SafeMC_ReadSafeOutData):

7.3.3.2.2 READ_SAFEIN_DATA: Read SafeIN data

Information:

Function READ SAFEIN DATA and associated data type ACP10SAFEINDAT typ are only available for ACOPOSmulti SafeMOTION inverter modules (EnDat 2.2 and SinCos) and ACOPOSmotor SafeMOTION EnDat 2.2.

Parameter:

ACP10SAFEINDAT typ safein data;

Function call:

```
SafeMC action(ax obj, SafeMC action READ SAFEIN DATA,
&safein data, sizeof(safein data));
```

Condition(s):

p_ax_dat->network.init == ncTRUE

7.3.3.2.3 READ_SAFEOUT_DATA2: Read SafeOUT data 2

Information:

Function READ_SAFEOUT_DATA2 and associated data type ACP10SAFEOUTDAT2_typ are only available for ACOPOS P3 SafeMOTION EnDat 2.2 servo drives.

Parameter:

ACP10SAFEOUTDAT2 typ safeout data;

Function call:

```
SafeMC_action(ax_obj,SafeMC_action_READ_SAFEOUT_DATA2,
&safeout data2,sizeof(safeout data2));
```

Condition(s):

p_ax_dat->network.init == ncTRUE

                          *p_ax_dat;
LOCAL ACP10SAFEOUTDAT_typ safeout_data;
LOCAL ACP10SAFEINDAT_typ safein_data;
void _INIT SafeMC_accessINIT( void )
   status_ncaccess = ncaccess(ncACP10MAN,"AxisObj1",(void *)&ax_obj);
   p_ax_dat = (ACP10AXIS_typ*)ax_obj;
}
void _CYCLIC SafeMC_accessCYCLIC( void )
   if ( status ncaccess != ncOK )
       return;
   if ( p ax dat->network.init == ncTRUE )
       status_safeout = SafeMC_action(ax_obj, SafeMC_action_READ_SAFEOUT_DATA,
                                      &safeout data, sizeof(safeout data));
       status_safein = SafeMC_action(ax_obj, SafeMC_action_READ_SAFEIN_DATA,
```

```
&safein_data, sizeof(safein_data));
}
```

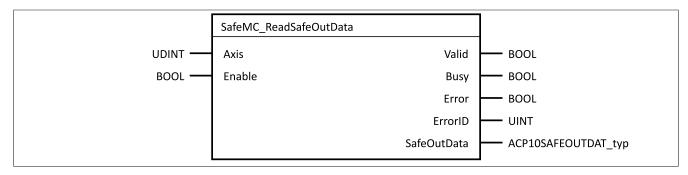

7.3.3.3 Accessing SafeMOTION data using SafeMOTION function blocks

7.3.3.3.1 Function block SafeMC_ReadSafeOutData: Read SafeOUT data

Information:

Function SafeMC_ReadSafeOutData and associated data type ACP10SAFEOUTDAT_typ are only available for ACOPOSmulti SafeMOTION inverter modules (EnDat 2.2 and SinCos) and ACOPOSmotor SafeMOTION EnDat 2.2.

Function block

Parameter

I/O	Parameter	Data type	Description
IN	Axis	UDINT	Axis reference (NC object)
IN	Enable	BOOL	If "Enable" is set, then the data will be read.
OUT	Valid	BOOL	Indicates that data in the output data structure is valid
OUT	Busy	BOOL	Function block not yet completed
OUT	Error	BOOL	Indicates a function block error
OUT	ErrorID	UINT	Function block error code (see 7.3.3.1 "function SafeMC_action(): Perform SafeMOTION
			action / Error codes" on page 477)
OUT	SafeOutData	ACP10SAFEOUTDAT_typ	Output data structure

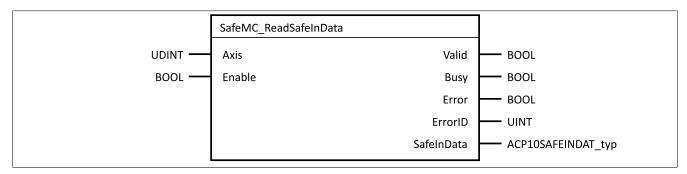

Data structure ACP10SAFEOUTDAT_typ, see 7.3.3.2.1 "READ_SAFEOUT_DATA: ReadSafeOUT data / data structure" on page 477

7.3.3.3.2 Function block SafeMC_ReadSafeInData: Read SafeIN data

Information:

Function SafeMC_ReadSafeInData and associated data type ACP10SAFEINDAT_typ are only available for ACOPOSmulti SafeMOTION inverter modules (EnDat 2.2 and SinCos) and ACOPOSmotor SafeMOTION EnDat 2.2.

Function block

Parameter

I/O	Parameter	Data type	Description
IN	Axis	UDINT	Axis reference (NC object)
IN	Enable	BOOL	If "Enable" is set, then the data will be read.
OUT	Valid	BOOL	Indicates that data in the output data structure is valid

Safety technology • Configuring the safety functions

I/O	Parameter	Data type	Description
OUT	Busy	BOOL	Function block not yet completed
OUT	Error	BOOL	Indicates a function block error
OUT	ErrorID		Function block error code (see "function SafeMC_action(): Perform SafeMOTION action / Error codes" on page)7.3.3.1 "Function SafeMC_action(): Perform SafeMOTION action" on page 477
OUT	SafeInData	ACP10SAFEINDAT_typ	Output data structure

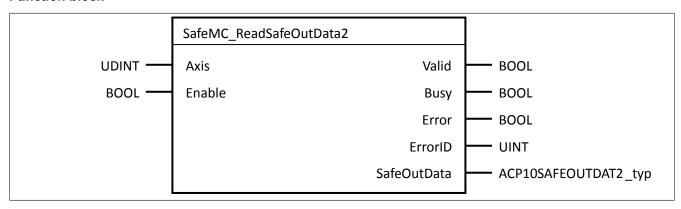

Data structure ACP10SAFEINDAT_typ, see 7.3.3.2.2 "READ_SAFEIN_DATA: Read SafeIN data / data structure" on page 478

7.3.3.3.3 Function block SafeMC_ReadSafeOutData2: Read SafeOut data 2

Information:

Function block SafeMC_ReadSafeOutData2 and associated data type ACP10SAFEOUTDAT2_typ are only available for ACOPOS P3 SafeMOTION EnDat 2.2 servo drives.

Function block

Parameter

I/O	Parameter	Data type	Description
IN	Axis	UDINT	Axis reference (NC object)
IN	Enable	BOOL	If "Enable" is set, then the data will be read.
OUT	Valid	BOOL	Indicates that data in the output data structure is valid
OUT	Busy	BOOL	Function block not yet completed
OUT	Error	BOOL	Indicates a function block error
OUT	ErrorID	UINT	Function block error code (see 7.3.3.1 "function SafeMC_action(): Perform SafeMOTION action / Error codes" on page 477)
OUT	SafeOutData	ACP10SAFEOUTDAT2_typ	Output data structure

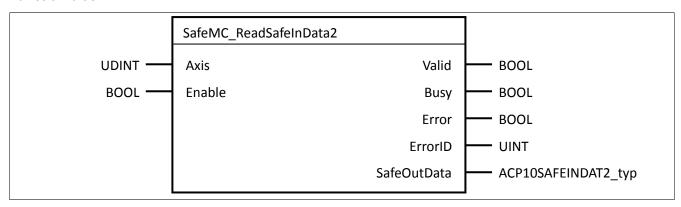

Data structure ACP10SAFEOUTDAT2_typ, see 7.3.3.2.3 "READ_SAFEOUT_DATA2: Read SafeOUT data 2 / data structure" on page 479

7.3.3.3.4 Function block SafeMC_ReadSafeInData2: Read SafeIN data 2

Information:

Function block SafeMC_ReadSafeInData2 and associated data type ACP10SAFEINDAT2_typ are only available for ACOPOS P3 SafeMOTION EnDat 2.2 servo drives.

Function block

Parameter

I/O	Parameter	Data type	Description
IN	Axis	UDINT	Axis reference (NC object)
IN	Enable	BOOL	If "Enable" is set, then the data will be read.
OUT	Valid	BOOL	Indicates that data in the output data structure is valid
OUT	Busy	BOOL	Function block not yet completed
OUT	Error	BOOL	Indicates a function block error
OUT	ErrorID	UINT	Function block error code (see "function SafeMC_action(): Perform SafeMOTION action / Error codes" on page)7.3.3.1 "Function SafeMC_action(): Perform SafeMOTION action" on page 477
OUT	SafeInData	ACP10SAFEINDAT2_typ	Output data structure

Data structure ACP10SAFEINDAT_typ, see 7.3.3.2.4 "READ_SAFEIN_DATA2: Read SafeIN data 2 / data structure" on page 479

7.3.3.3.5 Example: Accessing SafeOUT and SafeIN data

```
#include <bur/plctypes.h>
#include <SafeMC.h>
LOCAL UINT
                                 status_ncaccess;
LOCAL UDINT
                                ax obj;
_LOCAL ACP10AXIS_typ
                                *p_ax_dat;
_LOCAL SafeMC_ReadSafeOutData_typ SafeMC_ReadSafeOutData_0;
LOCAL SafeMC_ReadSafeInData_typ SafeMC_ReadSafeInData_0;
void INIT SafeMC accessINIT( void )
   status ncaccess = ncaccess(ncACP10MAN, "AxisObj1", (void *) &ax_obj);
   p ax dat = (ACP10AXIS typ*)ax obj;
   SafeMC_ReadSafeOutData_0.Axis = ax_obj;
   SafeMC_ReadSafeInData_0.Axis = ax_obj;
void CYCLIC SafeMC accessCYCLIC( void )
   if ( status_ncaccess != ncOK )
       return;
   SafeMC ReadSafeOutData 0.Enable = p ax dat->network.init;
   SafeMC ReadSafeOutData(&SafeMC ReadSafeOutData 0);
   SafeMC_ReadSafeInData_0.Enable = p_ax_dat->network.init;
   SafeMC ReadSafeInData(&SafeMC ReadSafeInData 0);
```

7.4 Validating the safety functions

Danger!

You are responsible for the functional testing of protective equipment.

You must therefore validate the protective equipment!

Information:

Applicable standards specify certain processes that must be followed when developing safety-related applications. You are solely responsible for establishing and adhering to these processes.

Danger!

Safety applications are only permitted to be developed by qualified personnel. Acceptance of the final product, validation and verification in particular, must also be performed by qualified personnel.

When commissioning a machine, the complete safety application must be tested, validated and verified in accordance with the SRS (Safety Requirements Specification).

When performing a comprehensive safety function test, all specified limits and timing values must be tested in accordance with the SRS. All monitored limits must be violated and the respective error responses then evaluated.

Each of the safety functions being used must be fully tested in regard to their respective limit values.

The physical units of the monitored limits must be tested! A function is considered "in use" if the respective function block input is used in the safety application.

The following tests are mandatory in all cases:

Safety function	Selects/Deselects the safety function	Checks the safe outputs	Violation of the deceleration ramp	Violation of the monitored speed limit	Violation of the monitored path	
STO	√	✓				
STO1	√	✓				
SBC	√	✓				
sos	√			√	✓	
SS1	√	✓	1			
SS2	√		1	√		
SLS1	√		1	√		
SLS2	✓		1	✓		
SLS3	√		1	✓		
SLS4	√		1	√		
SMS				✓		
SDIpos	√				✓	
SDIneg	✓				✓	
SLI	√				✓	
SLP	✓		√ 1)	√ 1)	✓	
SMP			√ 1)	√ 1)	✓	
SBT ²⁾	√	Violation of uppe	r/lower limit for test torque o	r torque of external load	✓	
SLA 3)	1	Violation of monitored limit for acceleration or deceleration with respect to current direction of movement				
RSP 4)	T '	Check	ed by performing the RSP p	procedure		
SLT 5)	✓		Monitored torg	ue limit exceeded		

Table 312: Test matrix for the safety functions

- 1) Speed limit calculated dynamically according to the current position.
- 2) Available with Safety Release 1.7 or later and only for ACOPOSmulti SafeMOTION SinCos!
- Available with Safety Release 1.9 or later!
- 4) Available with Safety Release 1.9 and later and only for SafeMOTION EnDat 2.2!
- 5) Safety Release 1.10 and later, hardware upgrades 1.10.2.x and later for ACOPOS P3 SafeMOTION only!

Danger!

Check the parameter settings for the unit system! An incorrectly configured unit system can cause dangerous situations since the monitored limits may not correspond to the physical limits under certain conditions!

7.5 Maintenance scenarios

7.5.1 Commissioning

When commissioning a machine, its safety functions must always undergo comprehensive testing, as described in 7.4 "Validating the safety functions" on page 485.

Danger!

All of the safety functions that are being used must be tested.

A function is considered to be "in use" if the corresponding input is connected or the safety function has been configured!

7.5.2 Replacing safe modules

The SafeLOGIC controller independently detects when safe modules have been replaced. Following a module replacement, the overall system (SafeLOGIC, openSAFETY) automatically ensures that the module is operated again using the correct parameters and that incompatible modules are rejected.

Replacing a safe ACOPOSmulti SafeMOTION inverter module or ACOPOS P3 SafeMOTION servo drive can result in the following potential errors. These errors must be excluded through testing:

- Wiring errors in the motor connection
- · Wiring errors in the motor holding brake connection
- · Connection of the wrong encoder

Danger!

Check all safety functions that are implemented on the replaced SafeMOTION inverter module! Always validate the entire safety function!

7.5.3 Replacing a safe encoder/motor

If a safe EnDat 2.2 FS encoder is replaced on a safe ACOPOSmulti SafeMOTION EnDat 2.2 inverter module or safe ACOPOS P3 SafeMOTION servo drive, this will be detected as a module replacement on the SafeLOGIC controller and must be acknowledged accordingly.

The SafeLOGIC controller <u>does not</u> detect when a motor or encoder is replaced on the safe ACOPOSmulti SafeMOTION SinCos inverter!

After the replacement, test the safety functions configured on the affected axis.

Danger!

An ACOPOSmotor SafeMOTION module can only be replaced in its entirety.

Replacing individual components is not possible since they are permanently installed.

Danger!

Check all safety functions that are implemented on the replaced SafeMOTION inverter module! Always validate the entire safety function!

7.5.4 Firmware updates / Acknowledging updated firmware

Changes to safety-related parts of the firmware are distributed by B&R as firmware updates.

Safety-relevant firmware is only permitted to be updated by qualified personnel.

A firmware update is indicated on the SafeLOGIC controller and must be acknowledged accordingly.

Danger!

A complete functional test must be performed following any modification to the firmware.

Danger!

Check the installed firmware version of the SafeMOTION modules used against the version listed in the respective certificate.

7.5.5 Decommissioning a system

SafeMOTION modules have a mission time of maximum 20 years.

This means that all SafeMOTION modules must be taken out of service one week (at the latest) before the expiration of this 20 year time span (starting from B&R's delivery date).

Danger!

Operating SafeMOTION modules beyond the specified mission time is not permitted!

The user must ensure that all SafeMOTION modules are replaced by new SafeMOTION modules or removed from operation <u>before</u> their mission time expires.

Chapter 7 • PLCopen_Motion_SF_2

1 Overview

Overview of the function blocks in the PLCopen_Motion_SF_2 library

Function block	Description	Safety Release			
SF_SafeMC_BR	SF_SafeMC_BR Assignment of safety functions S				
SF_SafeMC_Speed_BR	Links the safe speed of an axis and the associated status of the encoder error				
SF_SafeMC_BR_V2	Assignment of safety functions	Safety Release 1.4 or later			
SF_SafeMC_Position_BR	Links the safe position of an axis and the associated status				
SF_SafeMC_SBT_BR	Safe brake test	Safety Release 1.7 or later			
SF_SafeMC_BR_V3	Assignment of safety functions	Safety Release 1.9 or later			
SF_SafeMC_Position_BR_V2	Links the safe position of an axis and the associated status				

Table 313: Overview of the function blocks in the PLCopen_Motion_SF_2 library

2 Term definitions

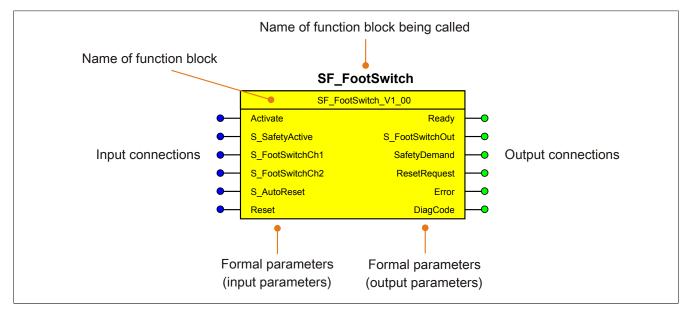

Figure 108: Components of a function block

When calling a function block, the inputs supply the input parameters with the current values of the variables or constants.

The output parameters supply the outputs with the associated values.

Inputs and outputs do not need to have the same name as the associated formal parameters, but they must be of the same data type. A difference in data type between formal parameters and inputs/outputs is reported as an error after compilation.

The name of a function block is composed of the function itself (e.g. "SF_FootSwitch", SF = safety function) and its version (Vx_yz). The format used to represent the version number in this document, Vx_yz , is a placeholder. For the actual version, see the function block being used.

3 SF_SafeMC_BR

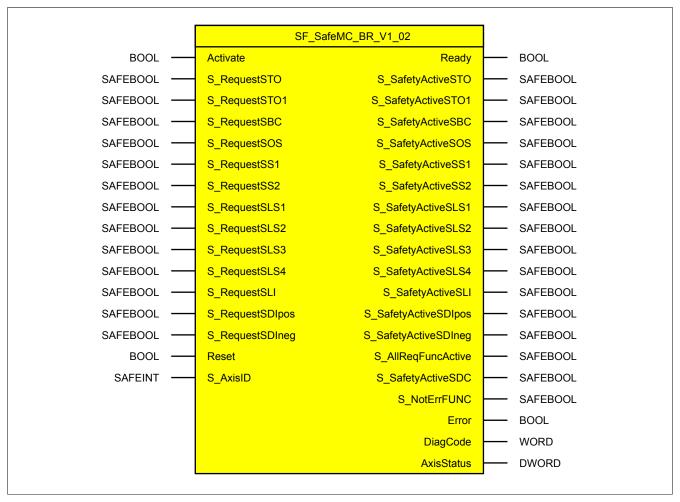

Figure 109: Function block SF_SafeMC_BR

3.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/ Constant	State	FALSE	Enables the function block (= TRUE)
S_RequestSTO	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	STO safety function request: SAFEFALSE: Safety function requested
S_RequestSTO1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	STO1 safety function request: SAFEFALSE: Safety function requested
S_RequestSBC	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SBC safety function request: SAFEFALSE: Safety function requested
S_RequestSOS	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SOS safety function request: SAFEFALSE: Safety function requested
S_RequestSS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SS1 safety function request: SAFEFALSE: Safety function requested
S_RequestSS2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SS2 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS1 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS2 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS3	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS3 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS4	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS4 safety function request: SAFEFALSE: Safety function requested
S_RequestSLI	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLI safety function request: SAFEFALSE: Safety function requested
S_RequestSDIpos	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SDIpos safety function request: SAFEFALSE: Safety function requested
S_RequestSDIneg	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SDIneg safety function request: SAFEFALSE: Safety function requested
Reset	BOOL	Variable	Edge	FALSE	Resets error messages and the SafeMOTION module after the cause of the error has been removed
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 314: SF_SafeMC_BR: Overview of input parameters

1) Evaluation of the input parameter signals in the function block. The signals must be controlled accordingly by the user.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled
S_SafetyActiveSTO	SAFEBOOL	Variable	State	SAFEFALSE	STO safety function active (= SAFETRUE)
S_SafetyActiveSTO1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function STO1 active (= SAFETRUE)
S_SafetyActiveSBC	SAFEBOOL	Variable	State	SAFEFALSE	SBC safety function active (= SAFETRUE)
S_SafetyActiveSOS	SAFEBOOL	Variable	State	SAFEFALSE	SOS safety function active, no violation of a monitored limit (= SAFETRUE)
S_SafetyActiveSS1	SAFEBOOL	Variable	State	SAFEFALSE	SS1 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSS2	SAFEBOOL	Variable	State	SAFEFALSE	SS2 safety function active, deceleration mon- itoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS1	SAFEBOOL	Variable	State	SAFEFALSE	SLS1 safety function active, deceleration mon- itoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS2	SAFEBOOL	Variable	State	SAFEFALSE	SLS2 safety function active, deceleration mon- itoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS3	SAFEBOOL	Variable	State	SAFEFALSE	SLS3 safety function active, deceleration mon- itoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS4	SAFEBOOL	Variable	State	SAFEFALSE	SLS4 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLI	SAFEBOOL	Variable	State	SAFEFALSE	SLI safety function active, no violation of a monitored limit (= SAFETRUE)
S_SafetyActiveSDIpos	SAFEBOOL	Variable	State	SAFEFALSE	SDIpos safety function active (= SAFETRUE)

Table 315: SF_SafeMC_BR: Overview of output parameters

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
S_SafetyActiveSDIneg	SAFEBOOL	Variable	State	SAFEFALSE	Safety function SDIneg active (= SAFETRUE)
S_AllReqFuncActive	SAFEBOOL	Variable	State	SAFEFALSE	All requested safety functions have achieved their safe state. (= SAFETRUE)
S_SafetyActiveSDC	SAFEBOOL	Variable	State	SAFEFALSE	Deceleration monitoring active (= SAFETRUE)
S_NotErrFUNC	SAFEBOOL	Variable	State	SAFEFALSE	SafeMOTION module not in the FUNCTIONAL FAIL SAFE state (= SAFETRUE)
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message
AxisStatus	DWORD	Variable	State	32#00000000	Status information from axis

Table 315: SF_SafeMC_BR: Overview of output parameters

1) Output of the output parameter signals. The signals must be evaluated and/or further processed accordingly by the user.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 316: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

3.2 SafeMOTION module parameters

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description		Default value	Starting in Safety Release
EUS - Count of physical reference system	-	Linear encode	r unit scale: X revolutions r unit scale: X reference lengths (reference length = length of ference system)	1	R 1.4
(previously Count of physical			•		
reference system)		positions (and For this reason per x revolutio	1/100 mm, 1/20 inch, degree of angle, etc.) can be used for data that can result such as speed and acceleration). I, the relationship between an integer multiple of this unit (units ns / units per x reference lengths) and a certain number of x reference lengths has to be previously defined.		
EUS - Units per count of physical reference system	[units]		r unit scale: Units per x revolutions r unit scale: Units per x reference lengths	1000	R 1.4
(previously Units per count of physical reference system [units])		positions (and For this reason per x revolutio	1/100 mm, 1/20 inch, degree of angle, etc.) can be used for data that can result such as speed and acceleration). In the relationship between an integer multiple of this unit (units ns / units per x reference lengths) and a certain number of x reference lengths has to be previously defined.		
EUS - Counting direction	Standard /	Counting direct	tion of the position or speed	Default	R 1.3
	Inverse	Value	Description		
(previously Counting direction)		Default	Encoder counting direction is equal to the counting direction of the unit system.		
		Inverse	Encoder counting direction is negative to the counting direction of the unit system.		
EUS - Maximum speed to nor- malize speed range	[units/s]	Maximum spec	ed to which the displayed speed should be normalized	32767	R 1.3
(previously Maximum speed to normalize the speed range (units/s))					

Table 317: SafeMOTION parameter group: General settings - Encoder Unit System

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

•	•			
Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 318: SafeMOTION parameter group: General settings - Ramp monitoring

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descript	ion	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled	addition	ramp-based monitoring (in to time-based monitoring) SS1 function is requested	1	R 1.3
		Value	Description

SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 329: SafeMOTION parameter group: Basic functions - SBC

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 330: SafeMOTION parameter group: Advanced functions - SDI

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

The following application rule must be observed:

 $LIM_{SOS} \leq LIM_{SLS4} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} \leq EUS - Maximum \ speed \ to \ normalize \ speed \ range \ normalize \ speed \ range \ normalize \ speed \ range \ normalize \ speed \ normalize \ speed \ normalize \ normalize \ speed \ normalize \ norm$

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

3.3 Integrated safety functions

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

3.4 Fault avoidance

Danger!

Validation

Each safety function that is used must be validated separately.

It is also necessary to test the entire safety application, including the interactions between individual functions.

3.4.1 Exceeding monitored limits

The SafeMOTION module monitors configurable limits. The drive itself, however, is controlled by the standard application on the standard PLC.

To prevent a violation of a monitored limit, the following points must be observed:

- The movement of the drive must be adapted to the requested safety function and initiated on time.
- The monitored limits must match the calculated limits and movement limitations. Make sure that the different configurations of the unit system match in the safety application and in the standard application!

Danger!

Any violation of a monitored limit will cause the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

Depending on the configuration, the motor holding brake will also be switched to 0 V.

In the event of an error, a synchronous axis will no longer be synchronous.

Check the Safety Logger in Automation Studio for detailed information about monitoring.

3.4.2 Plausibility error⁹⁾

Plausibility errors (limit values, data types, variables/constants) that occur when using the function block are detected and reported by either the function block or compiler.

This is not possible in the event of connection errors, however.

The function block does not check for the following errors:

- Actual parameter values or constants are within their valid range but incorrect for the safety function being executed.
- · Actual parameters have been connected incorrectly.
- Formal input/output parameters that should have been connected have not been connected.

Danger!

Ensuring proper safety function connections (sub-application) is your responsibility as the user! Check the connections when validating the sub-application!

3.4.3 Sporadically changing/toggling signal levels or impermissible signals¹⁰⁾

Sporadically changing or toggling signal levels on edge-controlled formal input parameters cause the function block to interpret this signal as an edge, which results in an unintended corresponding action being triggered in the function block if fault avoidance measures are not taken.

Sporadically changing or toggling signal levels on status-controlled input formal parameters will cause the signal to trigger an undesired corresponding action if error prevention measures are not taken.

Impermissible signals on input formal parameters can lead to an unexpected initial movement, non-execution of a requested action or an error message.

Possible causes of these signals:

⁹⁾ This section applies to all function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF:

¹⁰⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR, SF_SafeMC_BR, SF_SAfeMC_BR, SF_OS_MOTION_Basic_BR, SF_OS_MOTION_Speed_BR, SF_OS_MOTION_Advanced_BR, SF_OS_MOTION_AbsPos_BR, SF_OS_MOTION_BR

PLCopen Motion SF 2 • SF SafeMC BR

- Programming error in the application program (user error)
- Cross fault, short circuit or open circuit (user error, wiring error)
- · Error on the standard controller

To prevent this, the following measures can be taken depending on the safety function:

- · Using signals from safe devices
- Implementing additional measures for preventing a hazard if using a signal from a standard controller (e.g. executing an additional function start after a safety function has been triggered or an error has been corrected)
- · Line control on the safe control system
- · Suitable cabling when using non-safe signals from the standard controller
- · Verifying the source code in the application program and final validation of the safety functionality

These measures can also be combined to prevent errors.

It is important to note that a signal change detected on a status-controlled formal parameter will be output as a diagnostic code.

3.4.4 Simultaneous edge change¹¹⁾

Make sure that the "Reset" formal parameter is only connected to a signal from a manual resetting device to reduce the risk of an unexpected initial movement. This signal is based on your risk analysis.

3.4.5 Machine/System startup without performing functional testing of protective equipment¹²⁾

Faulty protective equipment is only detected following functional testing. Functional testing is not supported by this function block. If additional measures are not taken, faulty protective equipment can result in errors.

Danger!

You are responsible for the functional testing of protective equipment. You must therefore validate the protective equipment!

Possible causes of faulty protective equipment:

- Faulty devices (hardware error)
- · Cross fault, short circuit and open circuit (user error, wiring error)

This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR, SF_SafeMC_BR, V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR

¹²⁾ This section applies to all function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF:

3.5 Input parameters

3.5.1 General information about the "S_Request" inputs

The "S Request" inputs are used to request the respective safety functions.

If a safety function should not be used in the safety application, then the respective input should not be connected.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

At a minimum, the "Activate" and "S_AxisID" inputs must be connected. Otherwise, the SafeMOTION module will not be operated by the SafeLOGIC controller. As a result, the pulse disabling and motor holding brake outputs will be permanently set to 0 V, which means that the controller cannot be turned on.

3.5.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.
All binary output parameters are set to FALSE.
Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

Chapter PLCopen_N tion_SF_3

3.5.3 S_RequestSTO

General function

· Selects/Deselects safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO safety function.

TRUE

The safety function is deselected. Safe pulse disabling is not active!

FALSE

The safety function is selected. Safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

• None

3.5.4 S_RequestSTO1

General function

· Selects/Deselects safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO1 safety function.

TRUE

The safety function is deselected. Safe pulse disabling is not active!

FALSE

The safety function is selected. Depending on the configuration, the high-side or low-side of safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	High-side/	Selects the high-side or low-side IGBT in the STO1 function		High-side	R 1.3
	Low-side Value High-side	Value	Description		
(previously Channel selection for One Channel STO (STO1))		High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 331: SafeMOTION parameter group: Basic functions - STO1

- Mo-

3.5.5 S_RequestSBC

General function

· Selects/Deselects safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SBC safety function.

TRUE

The safety function is deselected. The motor holding brake output is enabled and can be used by the standard application.

FALSE

The safety function is selected. The motor holding brake output is switched to 0 V!

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 332: SafeMOTION parameter group: Basic functions - SBC

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

3.5.6 S_RequestSOS

General function

· Selects/Deselects safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SOS safety function.

TRUE

The safety function is deselected. Standstill tolerances are not being monitored.

FALSE

The safety function is selected. Standstill tolerances are being monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance (units</i>))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 333: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \leq LIM_{SLS4} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} < EUS - Maximum speed to normalize speed range$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

3.5.7 S_RequestSS1

General function

· Selects/Deselects safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS1 safety function.

TRUE

The safety function is deselected. SS1 is not active!

FALSE

The safety function is selected. Safe pulse disabling is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp [units/s ²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 334: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descripti	on	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled	Activates ramp-based monitoring (in addition to time-based monitoring) when the SS1 function is requested			R 1.3
		Value	Description		
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously Ramp Monitoring Time for SS1 (us))	[he]	Decelerat SS1	ion ramp monitoring time for	0	R 1.3

Table 335: SafeMOTION parameter group: Basic functions - SS1

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	Deceleration ramp monitoring is terminated prematurely if the value falls below the lower limit "Early limit monitoring": If the current speed during the deceleration process falls below the end speed limit of the activated safety function for a defined amount of time, then the safe state of the respective function will be activated prematurely. Value			R 1.3
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 336: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

To use this function without safe encoder evaluation, "Ramp monitoring for SS1" and "Early Limit Monitoring" must be disabled.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

3.5.8 S_RequestSS2

General function

· Selects/Deselects safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS2 safety function.

TRUE

The safety function is deselected. SS2 is not active!

FALSE

The safety function is selected. Standstill monitoring is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 337: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
SS2 - Ramp monitoring - Enable	Enabled/ Disabled		Activates ramp monitoring (in addition to time-based monitoring) when the SS2 function is requested		
		Value	Description		
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ramp monitoring time for SS2		0	R 1.3

Table 338: SafeMOTION parameter group: Speed functions - SS2

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable	Enabled/ Disabled	Deceleration ramp	Disabled	R 1.3	
(previously Early Limit Monitoring)		"Early limit monitor falls below the end amount of time, the vated prematurely			
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 340: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS4} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} < EUS$ - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

3.5.9 S_RequestSLS1

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS1 safety function.

TRUE

The safety function is deselected. SLS1 is not active!

FALSE

The safety function is selected. Speed limit 1 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 341: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description	Description		Starting in Safety Release
SLS - Ramp monitoring - Enable	Enabled/ Disabled	Activates ramp-bathe SLS function is	sed monitoring (in addition to time-based monitoring) when s requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)	Disabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time			
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS1 - Speed limit (previously Safe Speedlimit 1 for SLS (units/s))	[units/s]	Speed limit 1 for S	Speed limit 1 for SLS (SLS1)		R 1.3
SLS1 - Ramp monitoring - Time	[µs]	Deceleration ramp monitoring time for SLS1		0	R 1.3
(previously Ramp Monitoring Time for SLS1 (us))					

Table 342: SafeMOTION parameter group: Speed functions - SMS/SLS

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously Early Limit Monitoring)	Enabled/ Disabled	Deceleration ramp monitoring is terminated prematurely if the vibelow the lower limit "Early limit monitoring": If the current speed during the deceleratio falls below the end speed limit of the activated safety function for amount of time, then the safe state of the respective function with vated prematurely.			R 1.3
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 343: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

3.5.10 S_RequestSLS2

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 2

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS2 safety function.

TRUE

The safety function is deselected. SLS2 is not active!

FALSE

The safety function is selected. Speed limit 2 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp [units/s ²])

Table 346: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

3.5.11 S_RequestSLS3

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 3

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS3 safety function.

TRUE

The safety function is deselected. SLS3 is not active!

FALSE

The safety function is selected. Speed limit 3 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp [units/s ²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))

Early limit monitoring - Enable (previously Early Limit Monitoring)	Enabled/ Disabled	below the lower li "Early limit monito falls below the en	eceleration ramp monitoring is terminated prematurely if the value falls elow the lower limit Early limit monitoring": If the current speed during the deceleration process ills below the end speed limit of the activated safety function for a defined mount of time, then the safe state of the respective function will be acti- ated prematurely.		R 1.3
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 349: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

3.5.12 S_RequestSLS4

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 4

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS4 safety function.

TRUE

The safety function is deselected. SLS4 is not active!

FALSE

The safety function is selected. Speed limit 4 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 350: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SLS - Ramp monitoring - Enable	Enabled/ Disabled		-based monitoring (in addition to time-based monitoring) when on is requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)	Enabled Disabled	Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS4 - Speed limit (previously Safe Speedlimit 4 for SLS (units/s))	[units/s]	Speed limit 2 f	Speed limit 2 for SLS (SLS2)		R 1.3

(previously Ramp Monitoring Time for SLS4 (us))					

Table 351: SafeMOTION parameter group: Speed functions - SMS/SLS

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	Deceleration ramp monitoring is terminated prematurely if the value falls below the lower limit "Early limit monitoring": If the current speed during the deceleration process falls below the end speed limit of the activated safety function for a defined amount of time, then the safe state of the respective function will be activated prematurely.			R 1.3
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[he]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 352: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

3.5.13 S_RequestSLI

General function

· Selects/Deselects safety function Safely Limited Increment, SLI

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLI safety function.

TRUE

The safety function is deselected. SLI is not active!

FALSE

The safety function is selected. A safe range of increments is monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				

Table 353: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SLI (previously Safely Limited Increment)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLI - Position limit (previously Safe Increments (units))	[units]	Maximum movable increments when SLI is active	0	R 1.3
SLI - Disable delay time (previously SLI Off Delay (μs))	[µs]	Switch off delay of SLI	0	R 1.3

Table 354: SafeMOTION parameter group: Advanced functions - SLI

Danger!

The maximum increment range must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

3.5.14 S_RequestSDIpos

General function

· Selects/Deselects safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the positive direction of movement.

TRUE

The safety function is deselected. SDI is not active!

FALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the positive direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 355: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 356: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

3.5.15 S_RequestSDIneg

General function

• Selects/Deselects safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the negative direction of movement.

TRUE

The safety function is deselected. SDI is not active!

FALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the negative direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 357: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 358: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Chapter / PLCopen_Mo tion_SF_2

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

3.5.16 Reset

General function

 "Reset" input for acknowledging the FUNCTIONAL FAIL SAFE state or for putting the SafeMOTION module into OPERATIONAL state after STARTUP

Data type

BOOL

Connection

Variable

Function description

"Reset" input to acknowledge the FUNCTIONAL FAIL SAFE state

A positive edge triggers the reset function.

Depending on the configuration of parameter "Automatic Reset at Startup", a positive edge may be necessary to get the SafeMOTION module from state INIT to state OPERATIONAL after startup.

Relevant configuration parameters

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
Automatic reset on start - Enable (previously Automatic Reset at Startup)	Enabled/ Disabled	Activates automatic reset of the function block at startup		Disabled	R1.3
		Value	Description		
		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 359: SafeMOTION parameter group: General settings - Automatic reset on start

Danger!

Parameter "Automatic reset on start" enables/disables the restart interlock during startup or when a network failure occurs on a reestablished network connection.

If parameter "Automatic reset on start" is set to "Enabled", then the module automatically changes to state OPERATIONAL state (i.e. pulse disabling and the motor holding brake are enabled)!

Configuring an automatic restart can result in critical safety conditions. Take additional measures to ensure proper safety-related functionality.

3.5.17 S_AxisID

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and the SF_SafeMC_BR or SF_SafeMC_BR_Vx function block in the safety application. Otherwise, it will not be possible to compile the safety application.

3.6 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

3.6.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

PLCopen_M tion_SF_2

3.6.2 S_SafetyActiveSTO

General function

· Status information for safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

· Variable

Function description

Indicates the functional safe state of the STO safety function

TRUE

The STO safety function is active and currently in its safe state.

FALSE

The STO safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.3 S_SafetyActiveSTO1

General function

· Status information for safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO1 safety function

TRUE

The STO1 safety function is active and currently in its safe state.

FALSE

The STO1 safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

3.6.4 S_SafetyActiveSBC

General function

· Status information for safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

· Variable

Function description

Indicates the functional safe state of the SBC safety function

TRUE

The SBC safety function is active and currently in its safe state.

FALSE

The SBC safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.5 S_SafetyActiveSOS

General function

· Status information for safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SOS safety function

TRUE

The SOS safety function is active and currently in its safe state.

FALSE

The SOS safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

3.6.6 S_SafetyActiveSS1

General function

· Status information for safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS1 safety function

TRUE

The SS1 safety function is active and currently in its safe state.

FALSE

The SS1 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.7 S_SafetyActiveSS2

General function

· Status information for safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS2 safety function

TRUE

The SS2 safety function is active and currently in its safe state.

FALSE

The SS2 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

3.6.8 S_SafetyActiveSLS1

General function

· Status information for safety function Safely Limited Speed, Speed Limit 1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS1 safety function

TRUE

The SLS1 safety function is active and currently in its safe state.

FALSE

The SLS1 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.9 S_SafetyActiveSLS2

General function

· Status information for safety function Safely Limited Speed, Speed Limit 2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS2 safety function

TRUE

The SLS2 safety function is active and currently in its safe state.

FALSE

The SLS2 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_N tion_SF_

3.6.10 S_SafetyActiveSLS3

General function

· Status information for safety function Safely Limited Speed, Speed Limit 3

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS3 safety function

TRUE

The SLS3 safety function is active and currently in its safe state.

FALSE

The SLS3 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.11 S_SafetyActiveSLS4

General function

· Status information for safety function Safely Limited Speed, Speed Limit 4

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS4 safety function

TRUE

The SLS4 safety function is active and currently in its safe state.

FALSE

The SLS4 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.12 S_SafetyActiveSLI

General function

· Status information for safety function Safely Limited Increment

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLI safety function

TRUE

The SLI safety function is active and currently in its safe state.

FALSE

The SLI safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.13 S_SafetyActiveSDIpos

General function

• Status information for safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIpos safety function

TRUE

The SDIpos safety function is active and currently in its safe state.

FALSE

The SDIpos safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Cnapter PLCopen_N tion_SF_

3.6.14 S_SafetyActiveSDIneg

General function

• Status information for safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIneg safety function

TRUE

The SDIneg safety function is active and currently in its safe state.

FALSE

The SDIneg safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

3.6.15 S_SafetyActiveSDC

General function

· Information about the status of ramp monitoring

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the status of ramp monitoring.

TRUE

Ramp monitoring is active.

FALSE

Ramp monitoring is not active, the SafeMOTION module is currently in an error state or the function block has not been enabled.

Danger!

This signal should only be used for status information.

Chapter PLCopen_N tion_SF_

3.6.16 S_AIIReqFuncActive

General function

· Information about the status of the requested safety functions

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies the status of the requested safety functions.

TRUE

All requested safety functions are currently in their functional safe state.

FALSE

One or more safety functions have not yet achieved their safe state, the SafeMOTION module is in an error state or the function block has not been enabled.

3.6.17 S_NotErrFUNC

General function

Information about the error state of the safe SafeMOTION module

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies the error state of the SafeMOTION module.

TRUE

No error was found on the SafeMOTION module.

FALSE

An error was detected on the SafeMOTION module (e.g. a monitored limit was exceeded), or the function block has not been enabled.

In the event of an error, see the Safety Logger in Automation Studio for additional information about the error. If the error is a functional error, then it can be acknowledged by changing the signal on input "Reset" from FALSE to TRUE (positive edge)!

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_NotErrFUNC" does not represent the functional safe state of the SafeMOTION module!

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

3.6.18 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on the "Reset" input must change from FALSE to TRUE (positive edge).

3.6.19 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

3.6.20 Diagnostic codes

Code (hex)	State	Description	Possible workaround
0000	IDLE	The function block is not active.	Enable the function block by setting "Activate" to TRUE.
8001	INIT		Configure parameter "Startreset" accordingly or change to a positive edge on input "Reset".
8002	OPERATIONAL	The SafeMOTION module is in the OPERATIONAL state. No safety function is selected. The SMS speed limit is monitored according to the configuration.	'
8003	WAIT FOR CONFIRMATION	The SafeMOTION module is in the internal OPERATION-AL state. At least one safety function has been requested and at least one safety function has not yet achieved its functional safe state. None of the limits currently being monitored have been violated.	
8000	SAFE STATE	All requested safety functions have achieved their functional safe state. None of the limits currently being monitored have been violated.	·
C000	FUNCTIONAL FAIL SAFE	An error occurred!	Check the Safety Logger in Automation Studio. It will provide detailed information about the current error. Depending on the type of error, check the standard and/or safety application. For functional errors, check the configuration of the SafeMOTION module or replace the faulty SafeMOTION module.

Table 360: SF_SafeMC_BR(_V2, _V3): Diagnostic codes

3.6.21 AxisStatus

General function

· Diagnostics message from the function block, representation of the axis status bits in a DWORD

Data type

DWORD

Connection

Variable

Function description

The "AxisStatus" output returns bit-coded information about the status of individual safety functions. This information is equal to a summary of the "S_xxx" outputs in a DWORD. The individual bits have the following meaning:

Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
Status	Status	Status	Status	Status	Status	Status	Status
STO	SBC	SOS	SS1	SS2	SLS1	SLS2	SLS3
Bit 8	Bit 9	Bit 10	Bit 11	Bit 12	Bit 13	Bit 14	Bit 15
Status	Status	Status	Status	Status	-	-	-
SLS4	STO1	SDI pos	SLI	SDI neg			
Bit 16	Bit 17	Bit 18	Bit 19	Bit 20	Bit 21	Bit 22	Bit 23
-	Status Setposition Alive Test	Status SFR	Status All requested safe- ty functions active	Status SDC	Status Operational	Status Not Encoder Error	Status Not Functional Er- ror

Table 361: SF_SafeMC_BR: SafeMOTION module status bits

3.7 State machine

The state machine illustrated here is implemented on the SafeMOTION module.

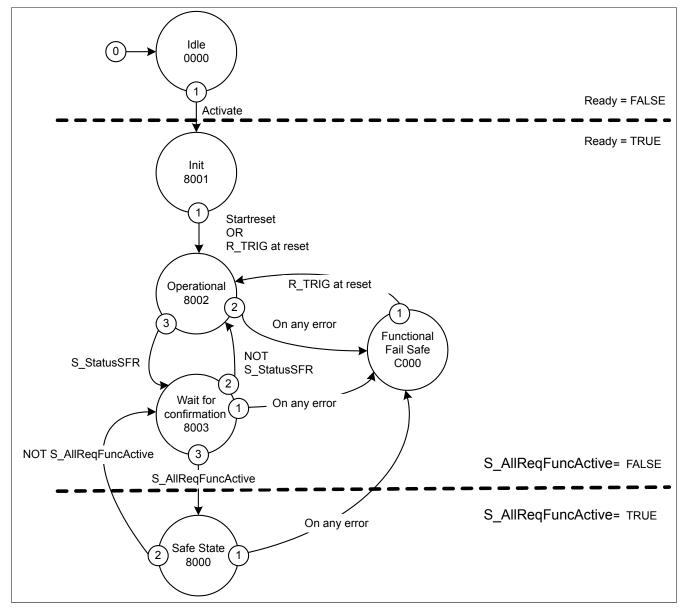

Figure 110: SF SafeMC BR(V2): State machine

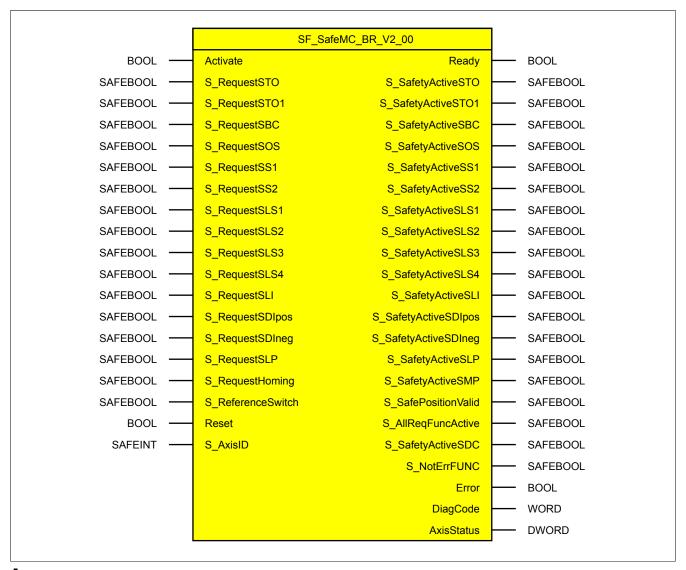

Individual states are reflected by the "DiagCode" output parameter. In this way, the function block provides a representation of the state machine on the SafeMOTION module.

3.8 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

4 SF_SafeMC_BR_V2

Information:

The SF_SafeMC_BR_V2_00 function block can only be used with Safety Release 1.4.

If Safety Release 1.3 is being used, then SafeDESIGNER will return an error when compiling the safety application!

4.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/ Constant	State	FALSE	Enables the function block (= TRUE)
S_RequestSTO	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	STO safety function request: SAFEFALSE: Safety function requested
S_RequestSTO1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	STO1 safety function request: SAFEFALSE: Safety function requested
S_RequestSBC	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SBC safety function request: SAFEFALSE: Safety function requested
S_RequestSOS	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SOS safety function request: SAFEFALSE: Safety function requested
S_RequestSS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SS1 safety function request: SAFEFALSE: Safety function requested
S_RequestSS2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SS2 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS1 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS2 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS3	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS3 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS4	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS4 safety function request: SAFEFALSE: Safety function requested
S_RequestSLI	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLI safety function request: SAFEFALSE: Safety function requested
S_RequestSDIpos	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SDIpos safety function request: SAFEFALSE: Safety function requested
S_RequestSDIneg	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SDIneg safety function request: SAFEFALSE: Safety function requested
S_RequestSLP	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLP safety function request SAFEFALSE: Safety function requested
S_RequestHoming	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safe homing Request is made on a positive edge!
S_ReferenceSwitch	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Safe input for a reference switch
Reset	BOOL	Variable	Edge	FALSE	Resets error messages and the SafeMOTION module after the cause of the er- ror has been removed
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 362: SF_SafeMC_BR_V2: Overview of input parameters

l) Evaluation of the input parameter signals in the function block. The signals must be controlled accordingly by the user.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled
S_SafetyActiveSTO	SAFEBOOL	Variable	State	SAFEFALSE	STO safety function active (= SAFETRUE)
S_SafetyActiveSTO1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function STO1 active (= SAFETRUE)
S_SafetyActiveSBC	SAFEBOOL	Variable	State	SAFEFALSE	SBC safety function active (= SAFETRUE)
S_SafetyActiveSOS	SAFEBOOL	Variable	State	SAFEFALSE	SOS safety function active, no violation of a monitored limit (= SAFETRUE)
S_SafetyActiveSS1	SAFEBOOL	Variable	State	SAFEFALSE	SS1 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSS2	SAFEBOOL	Variable	State	SAFEFALSE	SS2 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS1	SAFEBOOL	Variable	State	SAFEFALSE	SLS1 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS2	SAFEBOOL	Variable	State	SAFEFALSE	SLS2 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS3	SAFEBOOL	Variable	State	SAFEFALSE	SLS3 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)

Table 363: SF_SafeMC_BR_V2: Overview of output parameters

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
S_SafetyActiveSLS4	SAFEBOOL	Variable	State	SAFEFALSE	SLS4 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLI	SAFEBOOL	Variable	State	SAFEFALSE	SLI safety function active, no violation of a monitored limit (= SAFETRUE)
S_SafetyActiveSDIpos	SAFEBOOL	Variable	State	SAFEFALSE	SDIpos safety function active (= SAFETRUE)
S_SafetyActiveSDIneg	SAFEBOOL	Variable	State	SAFEFALSE	Safety function SDIneg active (= SAFETRUE)
S_SafetyActiveSLP	SAFEBOOL	Variable	State	SAFEFALSE	SLP safety function active (= SAFETRUE)
S_SafetyActiveSMP	SAFEBOOL	Variable	State	SAFEFALSE	SMP safety function active (= SAFETRUE)
S_SafePositionValid	SAFEBOOL	Variable	State	SAFEFALSE	Specifies whether the safe position is valid (=SAFETRUE, homing procedure has completed successfully and there are no encoder errors)
S_AllReqFuncActive	SAFEBOOL	Variable	State	SAFEFALSE	All requested safety functions have achieved their safe state. (= SAFETRUE)
S_SafetyActiveSDC	SAFEBOOL	Variable	State	SAFEFALSE	Deceleration monitoring active (= SAFETRUE)
S_NotErrFUNC	SAFEBOOL	Variable	State	SAFEFALSE	SafeMOTION module not in the FUNCTIONAL FAIL SAFE state (= SAFETRUE)
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message
AxisStatus	DWORD	Variable	State	32#00000000	Status information from axis

Table 363: SF_SafeMC_BR_V2: Overview of output parameters

1) Output of the output parameter signals. The signals must be evaluated and/or further processed accordingly by the user.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 364: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

4.2 SafeMOTION module parameters

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description		Default value	Starting in Safety Release
EUS - Count of physical reference system (previously Count of physical reference system)	-	Rotary encode Linear encode the physical re Any unit (mm positions (and For this reason		R 1.4	
EUS - Units per count of phys-	[units]	revolutions / x	ons / units per x reference lengths) and a certain number of x reference lengths has to be previously defined. er unit scale: Units per x revolutions	1000	R 1.4
ical reference system (previously <i>Units per count</i> of physical reference system [units])		Linear encoder unit scale: Units per x reference lengths Any unit (mm, 1/100 mm, 1/20 inch, degree of angle, etc.) can be used for positions (and data that can result such as speed and acceleration). For this reason, the relationship between an integer multiple of this unit (units per x revolutions / units per x reference lengths) and a certain number of x revolutions / x reference lengths has to be previously defined.			
EUS - Counting direction	Standard / Inverse	Counting direction of the position or speed Value Description		Default	R 1.3
(previously Counting direction)	inverse	Default	Description Encoder counting direction is equal to the counting direction of the unit system.		
		Inverse	Encoder counting direction is negative to the counting direction of the unit system.		
EUS - Length of physical ref- erence system for linear en- coder (previously Length of physical reference system for linear en- coder (nml))	[nm]	is defined here This value is r	For linear measurement systems, the length of a physical reference system is defined here. This value is not used for rotary encoders, where the reference system is a single revolution.		R 1.4
EUS - Maximum speed to normalize speed range (previously Maximum speed to normalize the speed range (units/s))	[units/s]	Maximum speed to which the displayed speed should be normalized		32767	R 1.3
EUS - Encoder acceleration limit (previously Maximum acceler-	[rad/s²] or [mm/s²]	Maximum per	missible encoder acceleration	100000	R 1.4
ation (rad/s² or mm/s²))					

Table 365: SafeMOTION parameter group: General settings - Encoder Unit System

Group: Absolute position functions - Homing (previously *Homing***)**

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Home position or home offset	[units]	Home position or home offset	0	R 1.4
(previously Home Position or Home Offset (units))				
Homing - Maximum trigger speed	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
(previously Max. trigger speed (units/s))				
Homing - Monitoring time	[µs]	Monitoring time for the homing procedure	0	R 1.4
(previously Homing Monitoring Time (µs))				
Homing - Mode	Direct / Reference	Selects the homing mode	Direct	R 1.4
(previously <i>Mode</i>)	switch / Home Offset / Home offset with correction	Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2!		

Table 366: SafeMOTION parameter group: Absolute position functions - Homing

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference sys- tem))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders.	0	R 1.4
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!		

Table 366: SafeMOTION parameter group: Absolute position functions - Homing

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp monitoring - Enable de- lay time (previously <i>Delay time to start</i> ramp monitoring (us))	[ha]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 367: SafeMOTION parameter group: General settings - Ramp monitoring

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descript	iion	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Disabled addition		s ramp-based monitoring (in to time-based monitoring) s SS1 function is requested		R 1.3
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously <i>Ramp Monitoring Time for</i> <i>SS1</i> (us))	[µs]	Decelera SS1	ttion ramp monitoring time for	0	R 1.3

Table 368: SafeMOTION parameter group: Basic functions - SS1

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release	
SS2 - Ramp monitoring - Enable	Enabled/ Disabled		activates ramp monitoring (in addition to time-based monitoring) when the ISS function is requested			
		Value Description				
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time			
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored			
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ramp monitoring time for SS2		0	R 1.3	

Table 369: SafeMOTION parameter group: Speed functions - SS2

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
Automatic reset on start - En-	Enabled/	Activates automatic reset of the function block at startup		Disabled	R1.3
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 370: SafeMOTION parameter group: General settings - Automatic reset on start

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	High-side/	Selects the high-sid	de or low-side IGBT in the STO1 function	High-side	R 1.3
	Low-side	Value	Description		
(previously Channel selection for One Channel STO (STO1))		High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 371: SafeMOTION parameter group: Basic functions - STO1

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description	Description		Starting in Safety Release
SMS - Enable	Enabled/	Activates the SM	IS safety function by configuration	Enabled	R 1.3
	Disabled	Value	Description		
(previously Safe Maximum		Enabled	SMS activated		
Speed)		Disabled	SMS deactivated		
SMS - Speed limit	[units/s]	Speed limit of the	e maximum speed (SMS)	0	R 1.3
(previously Maximum Speed for SMS (units/s))					
SLS1 - Speed limit	[units/s]	Speed limit 1 for	SLS (SLS1)	0	R 1.3
(previously Safe Speedlimit 1 for SLS (units/s))					
SLS2 - Speed limit	[units/s]	Speed limit 2 for	SLS (SLS2)	0	R 1.3
(previously Safe Speedlimit 2 for SLS (units/s))					
SLS3 - Speed limit	[units/s]	Speed limit 3 for	SLS (SLS3)	0	R 1.3
(previously Safe Speedlimit 3 for SLS (units/s))					
SLS4 - Speed limit	[units/s]	Speed limit 4 for	SLS (SLS4)	0	R 1.3
(previously Safe Speedlimit 4 for SLS (units/s))					

Table 372: SafeMOTION parameter group: Speed functions - SMS/SLS

Parameter	Unit	Description		Description		Default value	Starting in Safety Release
SLS - Ramp monitoring - Enable	Enabled/ Disabled		b-based monitoring (in addition to time-based monitoring) when on is requested	Enabled	R 1.3		
		Value	Description				
(previously Rampmonitoring for SLS)		Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time				
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored				
SLS1 - Ramp monitoring - Time	[µs]	Deceleration ramp monitoring time for SLS1 0		0	R 1.3		
(previously Ramp Monitoring Time for SLS1 (us))							
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ra	amp monitoring time for SLS2	0	R 1.3		
(previously Ramp Monitoring Time for SLS2 (us))							
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ra	amp monitoring time for SLS3	0	R 1.3		
(previously Ramp Monitoring Time for SLS3 (us))							
SLS4 - Ramp monitoring - Time	[µs]	Deceleration ra	amp monitoring time for SLS4	0	R 1.3		
(previously Ramp Monitoring Time for SLS4 (us))							

Table 372: SafeMOTION parameter group: Speed functions - SMS/SLS

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Description		Starting in Safety Release
SMP - Enable	Enabled/	Activates the S	SMP safety function from the configuration	Disabled	R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit	[units]	Lower position	limit for the machine's full travel range	0	R 1.4
(previously Safe Lower Position Limit for SMP (units))					
SMP - Upper position limit	[units]	Upper position	limit for the machine's full travel range	0	R 1.4
(previously Safe Upper Position Limit for SMP (units))					
SLP - Lower position limit	[units]	Lower position	limit for the monitoring range	0	R 1.4
(previously Safe Lower Position Limit for SLP (units))					
SLP - Upper position limit	[units]	Upper position	limit for the monitoring range	0	R 1.4
(previously Safe Upper Position Limit for SLP (units))					
SLP - Enable delay time	[µs]	Delay time bet	ween the SLP request and start of monitoring	0	R 1.4
(previously Delay time to start SLP (us))					

Table 373: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Group: General settings - Encoder monitoring (previously *Encoder Monitoring*)

Parameter	Unit	Description		Default value	Starting in Safety
Encoder monitoring - Safe En-	From motor data	Ctatus of the proof	f of fatigue strength of the encoder mounting	From motor data	Release R1.10
coder Mounting (Hardware up-	From motor data record / Approved	Value	Description	record	K1.10
grade 1.10.3.x and later)	by user		The status of the encoder mounting is determined using the motor data record.	record	
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.		
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the dule	Enabled	R1.3
		Value	Description		
(previously Encoder Position		Enabled	Monitoring active	1	
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Speed error monitoring - Enable	Enabled/ Disabled	Activates/Deactiva	ates monitoring of the speed error generated on the dule	Enabled	R1.3
		Value	Description		
(previously Encoder Speed		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Position setpoint alive testing (SPA) -	Enabled/ Disabled		ates the monitor that detects whether the position setpoint SafeMOTION module is frozen.	Disabled	R1.3
Enable		Value	Description		
		Enabled	Monitoring active		
(previously Set position alive testing)		Disabled	Monitoring not active		
Encoder monitoring - Position error tolerance	[units]	Position lag error t	olerance for shaft breakage monitoring	0	R1.3
(previously Encoder monitor- ing Position tolerance (units))					
Encoder monitoring - Speed error tolerance	[units/s]	Speed error tolera	nce for encoder monitoring	0	R1.3
(previously Encoder monitor- ing Speed tolerance (units/s))					

Table 374: SafeMOTION parameter group: General settings - Encoder monitoring

Group: General settings - Behavior of Functional Fail Safe (FFS) (previously *Behavior of Functional Fail Safe*)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
FFS - Mode	STO / STO1 and STO		AL FAIL SAFE state, STO and SBC are activated immesactivated and then STO after a delay.	STO	R 1.3
(previously Behavior of Func-	with time delay	Value	Description		
tional Fail Safe)		STO	In the FUNCTIONAL FAIL SAFE state, STO and SBC are activated immediately.		
		STO1 and STO with time delay	In the FUNCTIONAL FAIL SAFE state, STO1 and SBC are activated first, and then STO after a delay.		
FFS - STO Enable delay time (previously <i>Delay for STO in</i>	[µs]	Delay time betwee SAFE state	0	R 1.3	
Functional Fail Safe [µs])					
FFS - Delay time until brake	[µs]	Delay time before	e the brake engages	0	R 1.3
engages			le channel is activated after this delay time if STO1 and and SBC are configured for FUNCTIONAL FAIL SAFE.		
(previously Delay time until the brake engages [µs])

(previously Delay time to start SDI (us)				

Table 380: SafeMOTION parameter group: Advanced functions - SDI

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

The following application rule must be observed:

 $\mathsf{LIM}_{\mathsf{SOS}} \leq \mathsf{LIM}_{\mathsf{SLS4}} \leq \mathsf{LIM}_{\mathsf{SLS3}} \leq \mathsf{LIM}_{\mathsf{SLS2}} \leq \mathsf{LIM}_{\mathsf{SLS1}} \leq \mathsf{LIM}_{\mathsf{SMS}} \leq \mathsf{EUS} \text{ - Maximum speed to normalize speed range } \mathsf{LIM}_{\mathsf{SLS4}} \leq \mathsf{LIM}_{\mathsf{SLS4}}$

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

4.3 Integrated safety functions

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

4.4 Safe encoder connection monitoring

4.4.1 Encoder mounting with proof of fatigue strength¹³⁾

To prevent errors caused by encoder slippage or shaft breakage, the mechanical mounting of the encoder requires proof of fatigue strength.

This proof and the corresponding mounting guidelines can be provided either by the manufacturer of the measuring instrument or by the manufacturer of the machine.

Danger!

To ensure safe operation up to and including the motor shaft, any errors in the connection between the motor shaft and encoder must be identified and prevented.

Danger!

Proof of fatigue strength for the encoder's mechanical mounting is to be dimensioned to the maximum rotor acceleration. This acceleration value is not permitted to be exceeded in the worst case. The maximum acceleration is monitored on the SafeMOTION module and can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Mechanical tolerances in the encoder mounting must be taken into account when calculating the residual distance. This residual movement must be taken into account by the safety functions.

Danger!

To ensure safe operation up to and including the motor shaft, any errors in the connection between the motor shaft and encoder must be identified and prevented.

There are specific guidelines that must be followed when installing a functional safety encoder.

The motor manufacturer must ensure that these specifications are adhered to.

Danger!

The frictional connection between the cone-shaped shaft of the rotor and measuring instrument can be dimensioned for maximum rotor acceleration in accordance with the mounting instructions provided by the encoder manufacturer. This acceleration value is not permitted to be exceeded in the worst case. The maximum acceleration is monitored on the SafeMOTION module and can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

If the terminal screw for the coupling ring becomes loose on installed measuring instruments, then the form-fit pin will be the only thing holding the encoder to the motor housing. A movement in accordance with the mounting tolerances is possible. The encoder is not able to register this movement. This residual movement must be taken into account by the safety functions.

4.4.2 Encoder mounting without proof of fatigue strength - Safe lag error monitoring¹⁴⁾

If "General settings - Encoder monitoring" is activated in the SafeMOTION module, in some applications the proof of fatigue strength for the mechanical mounting of the encoder is not required.

The following safety-related restrictions must be taken into account!

Danger!

Only safety functions in which no safe absolute position is monitored are permitted to be used (STO, SBC, SOS, SS1, SS2, SLS, SMS, SLI, SDI, SLA, SBT (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION), SLT (only available for ACOPOS P3 SafeMOTION) and Safe Speed).

¹³⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

¹⁴⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

Danger!

The application must meet the following requirements for safety-related monitoring of the encoder-motor connection:

- Encoder connection monitoring is only permitted to be used for encoders that are integrated in position control.
- Encoder connection monitoring is only permitted to be used for drive systems with synchronous motors.
- The encoder must be protected against shearing in standstill (e.g. with encasement in the motor housing)!
- Monitoring for position lag errors, speed errors and position setpoints change (Alive Testing) must be enabled in the safety application, and sufficiently strict limits must be monitored!
- Safety functions Safe Position, SLP and/or SMP are not permitted to be not be used!
- Safe monitoring can only be guaranteed when closed-loop control is enabled.

Danger!

- An electrical offset of <90° will not be detected sufficiently.
- There is no way to monitor the encoder connection if the setpoint remains constant.
- An encoder connection error or an error in encoder evaluation is always assumed as the cause for the lag error.
- The error reaction in the standard application to a position lag error or speed error is disabled by the SafeMOTION module (overridden). When lag errors occur, only the error responses STO or STO1 with an induction stop are possible.

Danger!

Note that an error can result in a forward movement. The maximum angle of rotation ϕ of the motor shaft during this forward movement depends on the motor being used.

For permanent magnet synchronous motors, ϕ = 360°/2p. For three-phase induction motors, there is a relatively small angle of rotation between 5° and 15°.

The maximum speed of the forward movement can be calculated as follows:

$$n_{Jolt} = \frac{1}{2\pi} \sqrt{\frac{6a_{max}}{p_z}} \left[\frac{U}{S} \right]$$

With the maximum acceleration $a_{max} = \frac{M_{max}}{J} \left[\frac{rad}{s^2} \right]$ And number of motor pole pairs p_z

Danger!

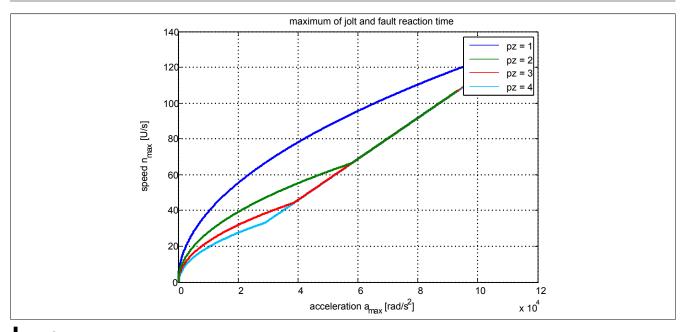

When viewing the worst-case scenario for a safety function, the highest value of the maximum speed of the forward movement n_{Jolt} And the speed due to the maximum error response time $n_{T_{Worstcase}}$.

$$n_{max} = max(n_{Jolt}, n_{T_{worstcase}}) = max\left(\frac{1}{2\pi}\sqrt{\frac{6a_{max}}{P_z}}, \frac{T_{worstcase}}{2\pi} \cdot a_{max}\right)$$

With the maximum error response time $T_{worstcase} = 7.2[ms]$

The maximum speed n_{max} resulting from this must be considered together with the speed when the safety function n_{LIM} is violated in order to determine the maximum possible speed $n_{worstcase}$ at the time of coasting to a stop.

$$n_{worstcase} = n_{LIM} + n_{max}$$

Information:

In order to check the plausibility of setpoint selection after each power on, the axis must be moved by at least twice the configured lag error limit before the first request of a safety function, which requires a safe encoder evaluation, or at least within 15 min.

If this is not done, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

In the event of an error, a synchronous axis will no longer be synchronous.

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Information:

A 24-hour timeout begins after successfully checking the plausibility of the setpoint.

The timeout is reset any time the position setpoint changes by more than twice the position lag error tolerance.

If the position setpoint does not change during 24 hours of continuous controller operation, then the SafeMOTION module will switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous.

The following parameters are relevant for safe monitoring of the encoder-motor shaft connection (Encoder Monitoring):

Group: General settings - Encoder monitoring (previously Encoder Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Release
Encoder monitoring - Safe En-			of fatigue strength of the encoder mounting	From motor data	R1.10
coder Mounting (Hardware up-	record / Approved	Value	Description	record	
grade 1.10.3.x and later)	by user	From motor data record	The status of the encoder mounting is determined using the motor data record.		
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.		
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the lule	Enabled	R1.3
		Value	Description		
(previously Encoder Position		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Speed error monitoring - Enable	Enabled/ Disabled	Activates/Deactivates monitoring of the speed error generated on the SafeMOTION module		Enabled	R1.3
(previously Encoder Speed		Value	Description		
		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Position setpoint alive testing (SPA) -	Enabled/ Disabled		tes the monitor that detects whether the position setpoint SafeMOTION module is frozen.	Disabled	R1.3
Enable		Value	Description		
(! O. (!! !! !!		Enabled	Monitoring active		
(previously Set position alive testing)		Disabled	Monitoring not active		
Encoder monitoring - Position error tolerance	[units]	Position lag error tolerance for shaft breakage monitoring		0	R1.3
(previously Encoder monitor- ing Position tolerance (units))					
Encoder monitoring - Speed error tolerance	[units/s]	Speed error tolera	nce for encoder monitoring	0	R1.3
(previously Encoder monitoring Speed tolerance (units/s))					

Table 381: SafeMOTION parameter group: General settings - Encoder monitoring

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description	Default value	Starting in Safety Release
EUS - Encoder acceleration limit	[rad/s²] or [mm/s²]	Maximum permissible encoder acceleration	100000	R 1.4
(previously Maximum acceleration (rad/s² or mm/s²))				

Table 382: SafeMOTION parameter group: General settings - Encoder Unit System

Information:

The physical drive speed is not permitted to exceed the value set for parameter "EUS - Maximum speed to normalize speed range"; otherwise, the SafeMOTION module will switch to the error state!

Danger!

If the manufacturer of the measuring instrument specifies a limitation of the maximum acceleration, this must be monitored by the SafeMOTION module. The acceleration to be monitored can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Incorrectly configuring the unit system can result in dangerous situations.

When validating the application, the monitored speed limits must be intentionally violated and their physical values tested! The same must also be done for the monitored direction of rotation!

Danger!

The machine manufacturer is responsible for determining whether or not the application is suited for safe encoder connection monitoring if there is no mechanical mechanism for detecting encoder shaft breakage.

The machine manufacturer is responsible for ensuring that the safe encoder monitoring has been configured correctly!

PLCopen_Mction_SF_2

Danger!

Encoder connection monitoring is only permitted to be used in a safety-related capacity if the aforementioned requirements for the application have been fulfilled!

4.4.2.1 Activating monitoring¹⁵⁾

The following parameters must be set to "Enabled" in SafeDESIGNER in order to enable safe encoder connection monitoring:

- "Encoder monitoring Position error monitoring Enable" = Enabled
- "Encoder monitoring Speed error monitoring Enable" = Enabled
- "Encoder monitoring Position setpoint alive testing (SPA) Enable" = Enabled

Danger!

In order to ensure safety-related monitoring of the encoder/motor connection, all three parameters "Encoder monitoring - Position error monitoring - Enable", "Encoder monitoring - Speed error monitoring - Enable" and "Encoder monitoring - Position setpoint alive testing (SPA) - Enable" must be set to "Enabled"!

If this is not the case, then the monitoring system cannot be used for safety purposes and a mechanical solution for detecting errors must be implemented!

4.4.2.2 Configuration rule for position lag error tolerance 16)

The position lag error tolerance must be set large enough to ensure availability. This can be done by first measuring the position lag error under the highest influence of disturbance variables and at maximum acceleration and then setting the position lag error tolerance accordingly higher.

Danger!

The position lag error tolerance is not permitted to be higher than half of one pole length!

If the safety function is activated, the size of the position lag error tolerance value affects how long it will take to look for errors and therefore also the error response time and estimation of the residual distance.

This must be taken into account by the machine manufacturer in the risk analysis!

Information:

Due to rounding errors, a reserve of 1 unit should be taken into account with the parameter "Encoder monitoring - Position error tolerance".

¹⁵⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

¹⁶⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

4.4.2.3 Configuration rule for speed error tolerance¹⁷⁾

The speed error tolerance must be set large enough to ensure availability.

This can be done by first measuring the speed error under the highest influence of disturbance variables and reference variables (e.g. at maximum acceleration) and then setting the speed error tolerance accordingly higher.

Danger!

When the safety function is enabled, the size of the speed error tolerance value affects how long it will take to look for errors and therefore also the error response time and estimation of the residual distance.

This must be taken into account by the machine manufacturer in the risk analysis!

Information:

Due to rounding errors, a reserve of 1 unit/s should be taken into account with the parameter "Encoder monitoring - Speed error tolerance".

¹⁷⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

4.5 Fault avoidance

Danger!

Validation

Each safety function that is used must be validated separately.

It is also necessary to test the entire safety application, including the interactions between individual functions.

4.5.1 Exceeding monitored limits

The SafeMOTION module monitors configurable limits. The drive itself, however, is controlled by the standard application on the standard PLC.

To prevent a violation of a monitored limit, the following points must be observed:

- The movement of the drive must be adapted to the requested safety function and initiated on time.
- The monitored limits must match the calculated limits and movement limitations. Make sure that the different configurations of the unit system match in the safety application and in the standard application!

Danger!

Any violation of a monitored limit will cause the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

Depending on the configuration, the motor holding brake will also be switched to 0 V.

In the event of an error, a synchronous axis will no longer be synchronous.

Check the Safety Logger in Automation Studio for detailed information about monitoring.

4.5.2 Plausibility error¹⁸⁾

Plausibility errors (limit values, data types, variables/constants) that occur when using the function block are detected and reported by either the function block or compiler.

This is not possible in the event of connection errors, however.

The function block does not check for the following errors:

- Actual parameter values or constants are within their valid range but incorrect for the safety function being executed.
- · Actual parameters have been connected incorrectly.
- Formal input/output parameters that should have been connected have not been connected.

Danger!

Ensuring proper safety function connections (sub-application) is your responsibility as the user! Check the connections when validating the sub-application!

4.5.3 Sporadically changing/toggling signal levels or impermissible signals¹⁹⁾

Sporadically changing or toggling signal levels on edge-controlled formal input parameters cause the function block to interpret this signal as an edge, which results in an unintended corresponding action being triggered in the function block if fault avoidance measures are not taken.

Sporadically changing or toggling signal levels on status-controlled input formal parameters will cause the signal to trigger an undesired corresponding action if error prevention measures are not taken.

Impermissible signals on input formal parameters can lead to an unexpected initial movement, non-execution of a requested action or an error message.

Possible causes of these signals:

¹⁸⁾ This section applies to all function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF:

¹⁹⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR, SF_SafeMC_BR, V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR

PLCopen Motion SF 2 • SF SafeMC BR V2

- Programming error in the application program (user error)
- Cross fault, short circuit or open circuit (user error, wiring error)
- · Error on the standard controller

To prevent this, the following measures can be taken depending on the safety function:

- · Using signals from safe devices
- Implementing additional measures for preventing a hazard if using a signal from a standard controller (e.g. executing an additional function start after a safety function has been triggered or an error has been corrected)
- · Line control on the safe control system
- · Suitable cabling when using non-safe signals from the standard controller
- · Verifying the source code in the application program and final validation of the safety functionality

These measures can also be combined to prevent errors.

It is important to note that a signal change detected on a status-controlled formal parameter will be output as a diagnostic code.

4.5.4 Simultaneous edge change²⁰⁾

Make sure that the "Reset" formal parameter is only connected to a signal from a manual resetting device to reduce the risk of an unexpected initial movement. This signal is based on your risk analysis.

4.5.5 Machine/System startup without performing functional testing of protective equipment²¹⁾

Faulty protective equipment is only detected following functional testing. Functional testing is not supported by this function block. If additional measures are not taken, faulty protective equipment can result in errors.

Danger!

You are responsible for the functional testing of protective equipment. You must therefore validate the protective equipment!

Possible causes of faulty protective equipment:

- Faulty devices (hardware error)
- · Cross fault, short circuit and open circuit (user error, wiring error)

²⁰⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR, SF_SafeMC_BR, V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR

²¹⁾ This section applies to all function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF:

PLCopen_M tion_SF_2

4.6 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

4.6.1 General information about the "S_Request" inputs

The "S_Request" inputs are used to request the respective safety functions.

If a safety function should not be used in the safety application, then the respective input should not be connected.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

At a minimum, the "Activate" and "S_AxisID" inputs must be connected. Otherwise, the SafeMOTION module will not be operated by the SafeLOGIC controller. As a result, the pulse disabling and motor holding brake outputs will be permanently set to 0 V, which means that the controller cannot be turned on.

4.6.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.

All binary output parameters are set to FALSE.

Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

Chapter Chapter PLCopen_N tion_SF_3

4.6.3 S_RequestSTO

General function

· Selects/Deselects safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO safety function.

TRUE

The safety function is deselected. Safe pulse disabling is not active!

FALSE

The safety function is selected. Safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

• None

4.6.4 S_RequestSTO1

General function

· Selects/Deselects safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO1 safety function.

TRUE

The safety function is deselected. Safe pulse disabling is not active!

FALSE

The safety function is selected. Depending on the configuration, the high-side or low-side of safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	High-side/ Low-side	Selects the high-side or low-side IGBT in the STO1 function Value Description		High-side	R 1.3
(previously Channel selection for One Channel STO (STO1))	High	High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 383: SafeMOTION parameter group: Basic functions - STO1

4.6.5 S_RequestSBC

General function

· Selects/Deselects safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SBC safety function.

TRUE

The safety function is deselected. The motor holding brake output is enabled and can be used by the standard application.

FALSE

The safety function is selected. The motor holding brake output is switched to 0 V!

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 384: SafeMOTION parameter group: Basic functions - SBC

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

4.6.6 S_RequestSOS

General function

· Selects/Deselects safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SOS safety function.

TRUE

The safety function is deselected. Standstill tolerances are not being monitored.

FALSE

The safety function is selected. Standstill tolerances are being monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously <i>Position Tolerance</i> (units))				

Table 385: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The following application rule must be observed:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

 $LIM_{SOS} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} < EUS - Maximum speed to normalize speed range$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

4.6.7 S_RequestSS1

General function

· Selects/Deselects safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS1 safety function.

TRUE

The safety function is deselected. SS1 is not active!

FALSE

The safety function is selected. Safe pulse disabling is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 386: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descripti	on	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled	addition	ramp-based monitoring (in to time-based monitoring) SS1 function is requested	Enabled	R 1.3
		Value	Description		
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously Ramp Monitoring Time for SS1 (us))	[he]	Decelerat SS1	ion ramp monitoring time for	0	R 1.3

Table 387: SafeMOTION parameter group: Basic functions - SS1

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	Deceleration ramp monitoring is terminated prematurely if the value falls below the lower limit "Early limit monitoring": If the current speed during the deceleration process falls below the end speed limit of the activated safety function for a defined amount of time, then the safe state of the respective function will be activated prematurely. Value			R 1.3
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 388: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

To use this function without safe encoder evaluation, "Ramp monitoring for SS1" and "Early Limit Monitoring" must be disabled.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

4.6.8 S_RequestSS2

General function

· Selects/Deselects safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS2 safety function.

TRUE

The safety function is deselected. SS2 is not active!

FALSE

The safety function is selected. Standstill monitoring is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 389: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
SS2 - Ramp monitoring - Enable	Enabled/ Disabled	Activates ramp mo SS2 function is req	Enabled	R 1.3	
		Value	Description		
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ramp monitoring time for SS2		0	R 1.3

Table 390: SafeMOTION parameter group: Speed functions - SS2

Chapter / PLCopen_Motion_SF_2

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance (units</i>))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 391: SafeMOTION parameter group: General settings - Standstill monitoring

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable	Enabled/	Deceleration ramp	Disabled	R 1.3	
(previously Early Limit Moni- toring)	Disabled	"Early limit monitor falls below the end amount of time, the vated prematurely			
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's			R 1.3
(previously Early Limit Monitoring time (us))		end state			

Table 392: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS4} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} < EUS$ - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

4.6.9 S_RequestSLS1

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS1 safety function.

TRUE

The safety function is deselected. SLS1 is not active!

FALSE

The safety function is selected. Speed limit 1 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))

4.6.13 S_RequestSLI

General function

· Selects/Deselects safety function Safely Limited Increment, SLI

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLI safety function.

TRUE

The safety function is deselected. SLI is not active!

FALSE

The safety function is selected. A safe range of increments is monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				

Table 405: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SLI (previously Safely Limited Increment)

,,,,,						
Parameter	Unit	Description	Default value	Starting in Safety Release		
SLI - Position limit	[units]	Maximum movable increments when SLI is active	0	R 1.3		
(previously Safe Increments (units))						
SLI - Disable delay time	[µs]	Switch off delay of SLI	0	R 1.3		
(previously SLI Off Delay (µs))						

Table 406: SafeMOTION parameter group: Advanced functions - SLI

Danger!

The maximum increment range must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

4.6.14 S_RequestSDIpos

General function

· Selects/Deselects safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the positive direction of movement.

TRUE

The safety function is deselected. SDI is not active!

FALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the positive direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 407: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 408: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

4.6.15 S_RequestSDIneg

General function

• Selects/Deselects safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the negative direction of movement.

TRUE

The safety function is deselected. SDI is not active!

FALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the negative direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 409: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 410: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

4.6.16 S_RequestSLP

General function

· Selects/Deselects safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLP safety function.

TRUE

The safety function is deselected. SLP is not active!

FALSE

The configured position window will be safety-monitored after "Delay time to start SLP (us)".

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 411: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLP - Lower position limit (previously Safe Lower Position Limit for SLP (units))	[units]	Lower position limit for the monitoring range	0	R 1.4
SLP - Upper position limit (previously Safe Upper Position Limit for SLP (units))	[units]	Upper position limit for the monitoring range	0	R 1.4
SLP - Enable delay time (previously <i>Delay time to start</i> SLP (us))	[µs]	Delay time between the SLP request and start of monitoring	0	R 1.4

Table 412: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(units/s)) Standstill monitoring - Position tolerance (previously Position Tolerance (units))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 413: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The following application rule must be observed:

 $\mathsf{LIM}_{\mathsf{SMP},\mathsf{NEG}} \leq \mathsf{LIM}_{\mathsf{SLP},\mathsf{NEG}} \leq \mathsf{LIM}_{\mathsf{SLP},\mathsf{POS}} \leq \mathsf{LIM}_{\mathsf{SMP},\mathsf{POS}}$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

Information:

Safe homing of the axis must be completed prior to using this safety function.

If a homing procedure is not completed successfully or the "S_SafePositionValid" status changes, then the request for the SLP safety function causes the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. The output of function block "S_NotErrFUNC" is reset.

4.6.17 S_RequestHoming

General function

· Selects/Deselects the "Safe Homing" safety function

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to start a "Safe Homing" procedure. A positive edge of the input starts the safety function.

Positive edge: Change from FALSE to TRUE

Starts "Safe Homing".

Negative edge: Change from TRUE to FALSE

If still active, the homing procedure will be terminated by the negative edge. This state transition has no effect if the homing procedure has already been completed.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Absolute position functions - Homing (previously *Homing***)**

Parameter	Unit Description		Default value	Starting in Safety Release	
Homing - Mode (previously <i>Mode</i>)	Direct / Reference switch / Home Offset / Home offset with correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Direct	R 1.4	
Homing - Home position or home offset (previously Home Position or Home Offset (units))	[units]	Home position or home offset	0	R 1.4	
Homing - Enable RSP (Rema- nent safe position) (previously Remanent safe po- sition)	Enabled/ Disabled	Selects whether or not to use the remanent safe position This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.9	
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4	
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4	

Table 414: SafeMOTION parameter group: Absolute position functions - Homing

Parameter	Unit Description Default value		Default value	Starting in Safety Release
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference sys- tem))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders. This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		R 1.4
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
Homing - Monitoring time (previously <i>Homing Monitoring Time</i> (μs))	[µs]	Monitoring time for the homing procedure	0	R 1.4

Table 414: SafeMOTION parameter group: Absolute position functions - Homing

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The Safe Homing function is needed in order to implement the safety functions SLP and SMP and for using the safe position.

The SafePositionValid status bit will remain set to SAFEFALSE until safe homing has been performed!

4.6.18 S_ReferenceSwitch

General function

· Reference switch input for the "Safe Homing" safety function

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter serves as a reference switch input for the "Safe Homing" safety function and is only evaluated in the "Reference Switch" homing mode.

The status of a safe reference switch that was read into the safety application via a safe input module (X20SIxxxx), for example, should be linked to the input.

Not connected

The reference switch is not being used!

Information:

If "Reference Switch" homing mode is configured and the reference switch input "S_ReferenceSwitch" is not wired on the function block, then the SafeMOTION module will switch to the FAIL SAFE state. The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Information:

The "S_ReferenceSwitch" input is only evaluated in "Reference Switch" homing mode. The input is ignored in other homing modes!

4.6.19 Reset

General function

 "Reset" input for acknowledging the FUNCTIONAL FAIL SAFE state or for putting the SafeMOTION module into OPERATIONAL state after STARTUP

Data type

BOOL

Connection

Variable

Function description

"Reset" input to acknowledge the FUNCTIONAL FAIL SAFE state

A positive edge triggers the reset function.

Depending on the configuration of parameter "Automatic Reset at Startup", a positive edge may be necessary to get the SafeMOTION module from state INIT to state OPERATIONAL after startup.

Relevant configuration parameters

Group: General settings - Automatic reset on start (previously General Settings)

•	•		· ,		
Parameter	Unit	Description		Default value	Used Starting in Safety Release
Automatic reset on start - En-	Enabled/	Activates automati	c reset of the function block at startup	Disabled	R1.3
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 415: SafeMOTION parameter group: General settings - Automatic reset on start

Danger!

Parameter "Automatic reset on start" enables/disables the restart interlock during startup or when a network failure occurs on a reestablished network connection.

If parameter "Automatic reset on start" is set to "Enabled", then the module automatically changes to state OPERATIONAL state (i.e. pulse disabling and the motor holding brake are enabled)!

Configuring an automatic restart can result in critical safety conditions. Take additional measures to ensure proper safety-related functionality.

4.6.20 S_AxisID

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and the SF_SafeMC_BR or SF_SafeMC_BR_Vx function block in the safety application. Otherwise, it will not be possible to compile the safety application.

Chapter PLCopen_N tion_SF_3

4.7 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

4.7.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

4.7.2 S_SafetyActiveSTO

General function

· Status information for safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO safety function

TRUE

The STO safety function is active and currently in its safe state.

FALSE

The STO safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

4.7.3 S_SafetyActiveSTO1

General function

· Status information for safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO1 safety function

TRUE

The STO1 safety function is active and currently in its safe state.

FALSE

The STO1 safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

4.7.4 S_SafetyActiveSBC

General function

· Status information for safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SBC safety function

TRUE

The SBC safety function is active and currently in its safe state.

FALSE

The SBC safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

4.7.5 S_SafetyActiveSOS

General function

· Status information for safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

· Variable

Function description

Indicates the functional safe state of the SOS safety function

TRUE

The SOS safety function is active and currently in its safe state.

FALSE

The SOS safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

4.7.6 S_SafetyActiveSS1

General function

· Status information for safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS1 safety function

TRUE

The SS1 safety function is active and currently in its safe state.

FALSE

The SS1 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

4.7.7 S_SafetyActiveSS2

General function

· Status information for safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS2 safety function

TRUE

The SS2 safety function is active and currently in its safe state.

FALSE

The SS2 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

4.7.8 S_SafetyActiveSLS1

General function

· Status information for safety function Safely Limited Speed, Speed Limit 1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS1 safety function

TRUE

The SLS1 safety function is active and currently in its safe state.

FALSE

The SLS1 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

4.7.9 S_SafetyActiveSLS2

General function

· Status information for safety function Safely Limited Speed, Speed Limit 2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS2 safety function

TRUE

The SLS2 safety function is active and currently in its safe state.

FALSE

The SLS2 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

4.7.10 S_SafetyActiveSLS3

General function

· Status information for safety function Safely Limited Speed, Speed Limit 3

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS3 safety function

TRUE

The SLS3 safety function is active and currently in its safe state.

FALSE

The SLS3 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

4.7.11 S_SafetyActiveSLS4

General function

· Status information for safety function Safely Limited Speed, Speed Limit 4

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS4 safety function

TRUE

The SLS4 safety function is active and currently in its safe state.

FALSE

The SLS4 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

4.7.12 S_SafetyActiveSLI

General function

· Status information for safety function Safely Limited Increment

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLI safety function

TRUE

The SLI safety function is active and currently in its safe state.

FALSE

The SLI safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

4.7.13 S_SafetyActiveSDIpos

General function

• Status information for safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIpos safety function

TRUE

The SDIpos safety function is active and currently in its safe state.

FALSE

The SDIpos safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

4.7.14 S_SafetyActiveSDIneg

General function

• Status information for safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIneg safety function

TRUE

The SDIneg safety function is active and currently in its safe state.

FALSE

The SDIneg safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

4.7.15 S_SafetyActiveSLP

General function

· Status information for safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLP safety function

TRUE

The SLP safety function is active and currently in its safe state.

FALSE

The SLP safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

4.7.16 S_SafetyActiveSMP

General function

· Status information for safety function Safe Maximum Position, SMP

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SMP safety function

TRUE

The SMP safety function is active and currently in its safe state.

FAI SF

Monitoring of the SMP position limits is not active. Monitoring is not active because the SafeMOTION module has not yet been homed, the function or the SafeMOTION module is in an error state or the function block has not been enabled.

Chapte PLCopen tion_SF

4.7.17 S_SafePositionValid

General function

• Status information for the "Safe Homing" safety function and the safe position

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether or not safe homing of the axis has been completed and whether or not the position signal is valid.

TRUE

The axis has been safely homed, and the safe position is valid.

FALSE

The axis has not yet been safely homed, the axis encoder signal contains errors, the SafeMOTION module is in an error state or the function block has not been enabled. The safe position is invalid!

Danger!

The purpose of this signal is only to provide additional information.

"S_SafePositionValid" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of the output parameter "S_SafePosition" is only valid if the output parameter "S_SafePositionValid" is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

4.7.18 S_SafetyActiveSDC

General function

· Information about the status of ramp monitoring

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the status of ramp monitoring.

TRUE

Ramp monitoring is active.

FALSE

Ramp monitoring is not active, the SafeMOTION module is currently in an error state or the function block has not been enabled.

Danger!

This signal should only be used for status information.

PLCopen_M tion_SF_2

4.7.19 S_AIIReqFuncActive

General function

· Information about the status of the requested safety functions

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies the status of the requested safety functions.

TRUE

All requested safety functions are currently in their functional safe state.

FALSE

One or more safety functions have not yet achieved their safe state, the SafeMOTION module is in an error state or the function block has not been enabled.

4.7.20 S_NotErrFUNC

General function

Information about the error state of the safe SafeMOTION module

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies the error state of the SafeMOTION module.

TRUE

No error was found on the SafeMOTION module.

FALSE

An error was detected on the SafeMOTION module (e.g. a monitored limit was exceeded), or the function block has not been enabled.

In the event of an error, see the Safety Logger in Automation Studio for additional information about the error. If the error is a functional error, then it can be acknowledged by changing the signal on input "Reset" from FALSE to TRUE (positive edge)!

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_NotErrFUNC" does not represent the functional safe state of the SafeMOTION module!

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

Chapter / PLCopen_M tion_SF_2

4.7.21 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on the "Reset" input must change from FALSE to TRUE (positive edge).

4.7.22 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

4.7.23 Diagnostic codes

Code (hex)	State	Description	Possible workaround
0000	IDLE	The function block is not active.	Enable the function block by setting "Activate" to TRUE.
8001	INIT		Configure parameter "Startreset" accordingly or change to a positive edge on input "Reset".
8002	OPERATIONAL	The SafeMOTION module is in the OPERATIONAL state. No safety function is selected. The SMS speed limit is monitored according to the configuration.	No action required
8003	WAIT FOR CONFIRMATION	The SafeMOTION module is in the internal OPERATION-AL state. At least one safety function has been requested and at least one safety function has not yet achieved its functional safe state. None of the limits currently being monitored have been violated.	
8000	SAFE STATE	All requested safety functions have achieved their functional safe state. None of the limits currently being monitored have been violated.	No action required
C000	FUNCTIONAL FAIL SAFE	An error occurred!	Check the Safety Logger in Automation Studio. It will provide detailed information about the current error. Depending on the type of error, check the standard and/or safety application. For functional errors, check the configuration of the SafeMOTION module or replace the faulty SafeMOTION module.

Table 416: SF_SafeMC_BR(_V2, _V3): Diagnostic codes

4.7.24 AxisStatus

General function

· Diagnostics message from the function block, representation of the axis status bits in a DWORD

Data type

DWORD

Connection

Variable

Function description

The "AxisStatus" output returns bit-coded information about the status of individual safety functions. This information is equal to a summary of the S_xxx outputs in a DWORD.

The individual bits have the following meaning:

Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
Status	Status	Status	Status	Status	Status	Status	Status
STO	SBC	SOS	SS1	SS2	SLS1	SLS2	SLS3
Bit 8	Bit 9	Bit 10	Bit 11	Bit 12	Bit 13	Bit 14	Bit 15
Status	Status	Status	Status	Status	Status	Status	Status
SLS4	STO1	SDI pos	SLI	SDI neg	SLP	SMP	PositionValid
Bit 16	Bit 17	Bit 18	Bit 19	Bit 20	Bit 21	Bit 22	Bit 23
-	Status Setposition Alive Test	Status SFR	Status All requested safety functions active	Status SDC	Status Operational	Status Not Encoder Error	Status Not Functional Er- ror

Table 417: SF_SafeMC_BR_V2: SafeMOTION module status bits

4.8 State machine

The state machine illustrated here is implemented on the SafeMOTION module.

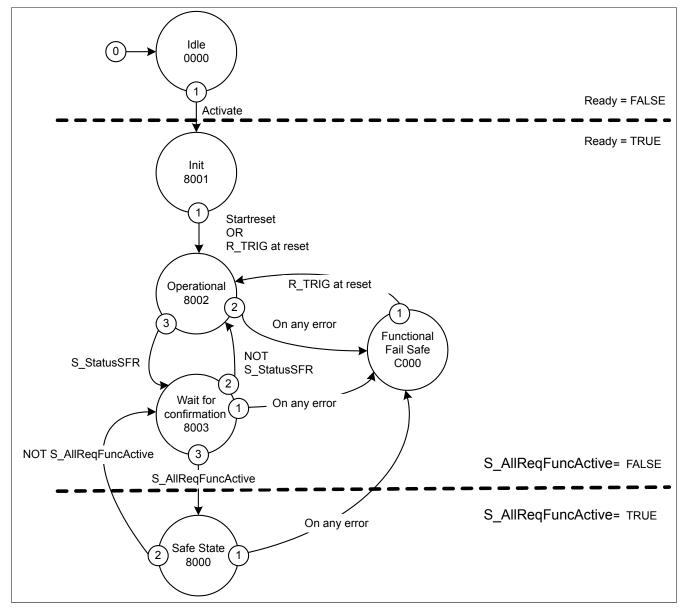

Figure 111: SF_SafeMC_BR(_V2): State machine

Individual states are reflected by the "DiagCode" output parameter. In this way, the function block provides a representation of the state machine on the SafeMOTION module.

4.9 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

5 SF_SafeMC_BR_V3

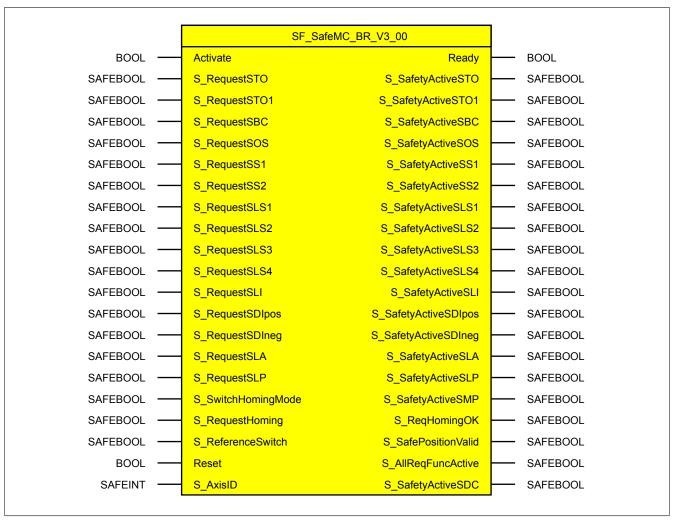

Figure 112: SF_SafeMC_BR_V3 function block

Information:

The SF_SafeMC_BR_V3_00 function block can only be used with Safety Release 1.9.

If a previous Safety Release is being used, then SafeDESIGNER will return an error when compiling the safety application!

5.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/ Constant	State	FALSE	Enables the function block (= TRUE)
S_RequestSTO	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	STO safety function request: SAFEFALSE: Safety function requested
S_RequestSTO1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	STO1 safety function request: SAFEFALSE: Safety function requested
S_RequestSBC	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SBC safety function request: SAFEFALSE: Safety function requested
S_RequestSOS	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SOS safety function request: SAFEFALSE: Safety function requested
S_RequestSS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SS1 safety function request: SAFEFALSE: Safety function requested
S_RequestSS2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SS2 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS1 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS2 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS3	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS3 safety function request: SAFEFALSE: Safety function requested
S_RequestSLS4	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLS4 safety function request: SAFEFALSE: Safety function requested
S_RequestSLI	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLI safety function request: SAFEFALSE: Safety function requested
S_RequestSDIpos	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SDIpos safety function request: SAFEFALSE: Safety function requested
S_RequestSDIneg	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SDIneg safety function request: SAFEFALSE: Safety function requested
S_RequestSLA	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLA safety function request SAFEFALSE: Safety function requested
S_RequestSLP	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SLP safety function request SAFEFALSE: Safety function requested
S_SwitchHomingMode	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Homing with RSP enabled. SAFEFALSE: Homing with RSP disabled.
S_RequestHoming	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safe homing Request is made on a positive edge!
S_ReferenceSwitch	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Safe input for a reference switch
Reset	BOOL	Variable	Edge	FALSE	Resets error messages and the SafeMOTION module after the cause of the er- ror has been removed
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 418: SF_SafeMC_BR_V3: Overview of input parameters

1) Evaluation of the input parameter signals in the function block. The signals must be controlled accordingly by the user.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled
S_SafetyActiveSTO	SAFEBOOL	Variable	State	SAFEFALSE	STO safety function active (= SAFETRUE)
S_SafetyActiveSTO1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function STO1 active (= SAFETRUE)
S_SafetyActiveSBC	SAFEBOOL	Variable	State	SAFEFALSE	SBC safety function active (= SAFETRUE)
S_SafetyActiveSOS	SAFEBOOL	Variable	State	SAFEFALSE	SOS safety function active, no violation of a monitored limit (= SAFETRUE)
S_SafetyActiveSS1	SAFEBOOL	Variable	State	SAFEFALSE	SS1 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSS2	SAFEBOOL	Variable	State	SAFEFALSE	SS2 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS1	SAFEBOOL	Variable	State	SAFEFALSE	SLS1 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS2	SAFEBOOL	Variable	State	SAFEFALSE	SLS2 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)

Table 419: SF_SafeMC_BR_V3: Overview of output parameters

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
S_SafetyActiveSLS3	SAFEBOOL	Variable	State	SAFEFALSE	SLS3 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLS4	SAFEBOOL	Variable	State	SAFEFALSE	SLS4 safety function active, deceleration monitoring completed, no violation of a monitored limit detected (= SAFETRUE)
S_SafetyActiveSLI	SAFEBOOL	Variable	State	SAFEFALSE	SLI safety function active, no violation of a monitored limit (= SAFETRUE)
S_SafetyActiveSDIpos	SAFEBOOL	Variable	State	SAFEFALSE	SDIpos safety function active (= SAFETRUE)
S_SafetyActiveSDIneg	SAFEBOOL	Variable	State	SAFEFALSE	Safety function SDIneg active (= SAFETRUE)
S_SafetyActiveSLA	SAFEBOOL	Variable	State	SAFEFALSE	SLA safety function is active, no violation of a monitored limit (= SAFETRUE)
S_SafetyActiveSLP	SAFEBOOL	Variable	State	SAFEFALSE	SLP safety function active (= SAFETRUE)
S_SafetyActiveSMP	SAFEBOOL	Variable	State	SAFEFALSE	SMP safety function active (= SAFETRUE)
S_ReqHomingOK	SAFEBOOL	Variable	State	SAFEFALSE	Feedback for homing in SafeDESIGNER (=SAFETRUE, safe position is valid and request for safe homing is SAFETRUE)
S_SafePositionValid	SAFEBOOL	Variable	State	SAFEFALSE	Specifies whether the safe position is valid (=SAFETRUE, homing procedure has completed successfully and there are no encoder errors)
S_AllReqFuncActive	SAFEBOOL	Variable	State	SAFEFALSE	All requested safety functions have achieved their safe state. (= SAFETRUE)
S_SafetyActiveSDC	SAFEBOOL	Variable	State	SAFEFALSE	Deceleration monitoring active (= SAFETRUE)
S_NotErrFUNC	SAFEBOOL	Variable	State	SAFEFALSE	SafeMOTION module not in the FUNCTIONAL FAIL SAFE state (= SAFETRUE)
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message
AxisStatus	DWORD	Variable	State	32#00000000	Status information from axis

Table 419: SF_SafeMC_BR_V3: Overview of output parameters

Output of the output parameter signals. The signals must be evaluated and/or further processed accordingly by the user.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 420: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

5.2 SafeMOTION module parameters

Group: Safe machine options (previously Additional Parameter)

Parameter	Unit	Description	Default value	Used starting in Safety Release
Safe machine options - Enable	Enabled/ Disabled	Activates/Deactivates the "Safe machine options" safety function	Disabled	R 1.9
(previously Activate Safe Machine Options)				

Table 421: SafeMOTION parameter group: Safe machine options

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description		D	Default value	Starting in Safety Release
EUS - Count of physical reference system (previously <i>Count of physical reference system</i>)	-	Rotary encoder unit scale: X revolutions Linear encoder unit scale: X reference lengths (reference length = length of the physical reference system) Any unit (mm, 1/100 mm, 1/20 inch, degree of angle, etc.) can be used for positions (and data that can result such as speed and acceleration). For this reason, the relationship between an integer multiple of this unit (units per x revolutions / units per x reference lengths) and a certain number of x				R 1.4
EUS - Units per count of physical reference system (previously Units per count of physical reference system [units])	[units]	revolutions / units per x reterence lengths) and a certain number of x revolutions / x reference lengths has to be previously defined. Rotary encoder unit scale: Units per x revolutions Linear encoder unit scale: Units per x reference lengths Any unit (mm, 1/100 mm, 1/20 inch, degree of angle, etc.) can be used for positions (and data that can result such as speed and acceleration). For this reason, the relationship between an integer multiple of this unit (units per x revolutions / units per x reference lengths) and a certain number of x revolutions / x reference lengths has to be previously defined.		000	R 1.4	
EUS - Counting direction (previously Counting direction)	Standard / Inverse	Counting direction Value Default Inverse	Description Encoder counting direction is equal to the rection of the unit system. Encoder counting direction is negative the direction of the unit system.	he counting di-	Default	R 1.3
EUS - Length of physical ref- erence system for linear en- coder (previously Length of physical reference system for linear en- coder (nml)	[nm]	For linear measurement systems, the length of a physical reference system is defined here. This value is not used for rotary encoders, where the reference system is a single revolution.		00000000	R 1.4	
EUS - Maximum speed to nor- malize speed range (previously Maximum speed to normalize the speed range (units/s))	[units/s]	Maximum speed to which the displayed speed should be normalized		malized 32	2767	R 1.3
EUS - Encoder acceleration limit (previously Maximum acceleration (rad/s² or mm/s²))	[rad/s²] or [mm/s²]	Maximum permis	ssible encoder acceleration	10	00000	R 1.4

Table 422: SafeMOTION parameter group: General settings - Encoder Unit System

Group: Absolute position functions - Homing (previously *Homing***)**

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Home position or home offset (previously Home Position or Home Offset (units))	[units]	Home position or home offset	0	R 1.4
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
Homing - Monitoring time (previously <i>Homing Monitoring</i> <i>Time</i> (μs))	[µs]	Monitoring time for the homing procedure	0	R 1.4

Table 423: SafeMOTION parameter group: Absolute position functions - Homing

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Mode (previously <i>Mode</i>)	Direct / Reference switch / Home Offset / Home offset with correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2!	Direct	R 1.4
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference sys- tem))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders.	0	R 1.4
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!

(previously Delay time to start SBC (us)				

Table 437: SafeMOTION parameter group: Basic functions - SBC

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 438: SafeMOTION parameter group: Advanced functions - SDI

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

The following application rule must be observed:

 $\mathsf{LIM}_{\mathsf{SOS}} \leq \mathsf{LIM}_{\mathsf{SLS4}} \leq \mathsf{LIM}_{\mathsf{SLS3}} \leq \mathsf{LIM}_{\mathsf{SLS2}} \leq \mathsf{LIM}_{\mathsf{SLS1}} \leq \mathsf{LIM}_{\mathsf{SMS}} \leq \mathsf{EUS} \text{ - Maximum speed to normalize speed range}$

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

5.3 Integrated safety functions

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

5.4 Safe encoder connection monitoring

5.4.1 Encoder mounting with proof of fatigue strength²²⁾

To prevent errors caused by encoder slippage or shaft breakage, the mechanical mounting of the encoder requires proof of fatigue strength.

This proof and the corresponding mounting guidelines can be provided either by the manufacturer of the measuring instrument or by the manufacturer of the machine.

Danger!

To ensure safe operation up to and including the motor shaft, any errors in the connection between the motor shaft and encoder must be identified and prevented.

Danger!

Proof of fatigue strength for the encoder's mechanical mounting is to be dimensioned to the maximum rotor acceleration. This acceleration value is not permitted to be exceeded in the worst case. The maximum acceleration is monitored on the SafeMOTION module and can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Mechanical tolerances in the encoder mounting must be taken into account when calculating the residual distance. This residual movement must be taken into account by the safety functions.

Danger!

To ensure safe operation up to and including the motor shaft, any errors in the connection between the motor shaft and encoder must be identified and prevented.

There are specific guidelines that must be followed when installing a functional safety encoder.

The motor manufacturer must ensure that these specifications are adhered to.

Danger!

The frictional connection between the cone-shaped shaft of the rotor and measuring instrument can be dimensioned for maximum rotor acceleration in accordance with the mounting instructions provided by the encoder manufacturer. This acceleration value is not permitted to be exceeded in the worst case. The maximum acceleration is monitored on the SafeMOTION module and can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

If the terminal screw for the coupling ring becomes loose on installed measuring instruments, then the form-fit pin will be the only thing holding the encoder to the motor housing. A movement in accordance with the mounting tolerances is possible. The encoder is not able to register this movement. This residual movement must be taken into account by the safety functions.

5.4.2 Encoder mounting without proof of fatigue strength - Safe lag error monitoring²³⁾

If "General settings - Encoder monitoring" is activated in the SafeMOTION module, in some applications the proof of fatigue strength for the mechanical mounting of the encoder is not required.

The following safety-related restrictions must be taken into account!

Danger!

Only safety functions in which no safe absolute position is monitored are permitted to be used (STO, SBC, SOS, SS1, SS2, SLS, SMS, SLI, SDI, SLA, SBT (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION), SLT (only available for ACOPOS P3 SafeMOTION) and Safe Speed).

²²⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

²³⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

Danger!

The application must meet the following requirements for safety-related monitoring of the encoder-motor connection:

- Encoder connection monitoring is only permitted to be used for encoders that are integrated in position control.
- Encoder connection monitoring is only permitted to be used for drive systems with synchronous motors.
- The encoder must be protected against shearing in standstill (e.g. with encasement in the motor housing)!
- Monitoring for position lag errors, speed errors and position setpoints change (Alive Testing)
 must be enabled in the safety application, and sufficiently strict limits must be monitored!
- Safety functions Safe Position, SLP and/or SMP are not permitted to be not be used!
- Safe monitoring can only be guaranteed when closed-loop control is enabled.

Danger!

- An electrical offset of <90° will not be detected sufficiently.
- There is no way to monitor the encoder connection if the setpoint remains constant.
- An encoder connection error or an error in encoder evaluation is always assumed as the cause for the lag error.
- The error reaction in the standard application to a position lag error or speed error is disabled by the SafeMOTION module (overridden). When lag errors occur, only the error responses STO or STO1 with an induction stop are possible.

Danger!

Note that an error can result in a forward movement. The maximum angle of rotation ϕ of the motor shaft during this forward movement depends on the motor being used.

For permanent magnet synchronous motors, ϕ = 360°/2p. For three-phase induction motors, there is a relatively small angle of rotation between 5° and 15°.

The maximum speed of the forward movement can be calculated as follows:

$$n_{Jolt} = \frac{1}{2\pi} \sqrt{\frac{6a_{max}}{p_z}} \left[\frac{U}{S} \right]$$

With the maximum acceleration $a_{max} = \frac{M_{max}}{J} \left[\frac{rad}{s^2} \right]$ And number of motor pole pairs p_z

Danger!

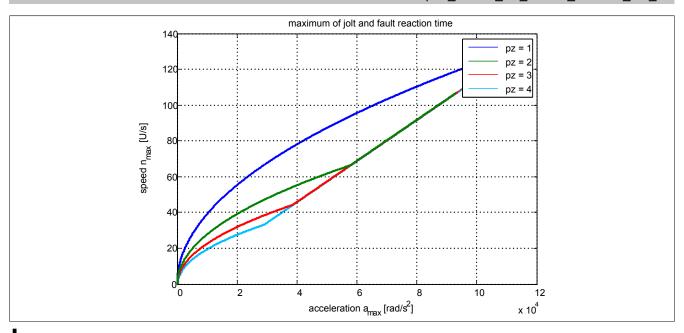

When viewing the worst-case scenario for a safety function, the highest value of the maximum speed of the forward movement n_{Jolt} And the speed due to the maximum error response time $n_{T_{Worstcase}}$.

$$n_{max} = max(n_{Jolt}, n_{T_{worstcase}}) = max\left(\frac{1}{2\pi}\sqrt{\frac{6a_{max}}{P_z}}, \frac{T_{worstcase}}{2\pi} \cdot a_{max}\right)$$

With the maximum error response time $T_{worstcase} = 7.2[ms]$

The maximum speed n_{max} resulting from this must be considered together with the speed when the safety function n_{LIM} is violated in order to determine the maximum possible speed $n_{worstcase}$ at the time of coasting to a stop.

$$n_{worstcase} = n_{LIM} + n_{max}$$

Information:

In order to check the plausibility of setpoint selection after each power on, the axis must be moved by at least twice the configured lag error limit before the first request of a safety function, which requires a safe encoder evaluation, or at least within 15 min.

If this is not done, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

In the event of an error, a synchronous axis will no longer be synchronous.

Danger!

Situations involving external forces (e.g. hanging loads) can result in dangerous movements! If this poses a safety risk, then the user must implement the necessary equipment to eliminate the risk (e.g. mechanical brakes)! This equipment must correspond to the required safety level!

Information:

A 24-hour timeout begins after successfully checking the plausibility of the setpoint.

The timeout is reset any time the position setpoint changes by more than twice the position lag error tolerance.

If the position setpoint does not change during 24 hours of continuous controller operation, then the SafeMOTION module will switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state. The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous.

The following parameters are relevant for safe monitoring of the encoder-motor shaft connection (Encoder Monitoring):

Group: General settings - Encoder monitoring (previously Encoder Monitoring)

Parameter	Unit	Description		Description Default value		Default value	Starting in Safety Release
Encoder monitoring - Safe En-		Status of the proof	of fatigue strength of the encoder mounting	From motor data	R1.10		
coder Mounting (Hardware up-	record / Approved	Value	Description	record			
grade 1.10.3.x and later)	by user	From motor data record	The status of the encoder mounting is determined using the motor data record.				
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.				
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the lule	Enabled	R1.3		
		Value	Description				
(previously Encoder Position		Enabled	Monitoring active				
monitoring)		Disabled	Monitoring not active				
Encoder monitoring - Speed error monitoring - Enable	Enabled/ Disabled	Activates/Deactivates monitoring of the speed error generated on the SafeMOTION module		Enabled	R1.3		
(previously Encoder Speed		Value	Description				
		Enabled	Monitoring active				
monitoring)		Disabled	Monitoring not active				
Encoder monitoring - Position setpoint alive testing (SPA) -	Enabled/ Disabled	Activates/Deactivates the monitor that detects whether the position setpoint generated on the SafeMOTION module is frozen.		Disabled	R1.3		
Enable		Value	Description				
(! O. (!! !! !!		Enabled	Monitoring active				
(previously Set position alive testing)		Disabled	Monitoring not active				
Encoder monitoring - Position error tolerance	[units]	Position lag error t	olerance for shaft breakage monitoring	0	R1.3		
(previously Encoder monitor- ing Position tolerance (units))							
Encoder monitoring - Speed error tolerance	[units/s]	Speed error tolera	nce for encoder monitoring	0	R1.3		
(previously Encoder monitoring Speed tolerance (units/s))							

Table 439: SafeMOTION parameter group: General settings - Encoder monitoring

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description	Default value	Starting in Safety Release
EUS - Encoder acceleration limit	[rad/s²] or [mm/s²]	Maximum permissible encoder acceleration	100000	R 1.4
(previously Maximum acceler- ation (rad/s² or mm/s²))				

Table 440: SafeMOTION parameter group: General settings - Encoder Unit System

Information:

The physical drive speed is not permitted to exceed the value set for parameter "EUS - Maximum speed to normalize speed range"; otherwise, the SafeMOTION module will switch to the error state!

Danger!

If the manufacturer of the measuring instrument specifies a limitation of the maximum acceleration, this must be monitored by the SafeMOTION module. The acceleration to be monitored can be configured using parameter "EUS - Encoder acceleration limit".

Danger!

Incorrectly configuring the unit system can result in dangerous situations.

When validating the application, the monitored speed limits must be intentionally violated and their physical values tested! The same must also be done for the monitored direction of rotation!

Danger!

The machine manufacturer is responsible for determining whether or not the application is suited for safe encoder connection monitoring if there is no mechanical mechanism for detecting encoder shaft breakage.

The machine manufacturer is responsible for ensuring that the safe encoder monitoring has been configured correctly!

PLCopen_Mction_SF_2

Danger!

Encoder connection monitoring is only permitted to be used in a safety-related capacity if the aforementioned requirements for the application have been fulfilled!

5.4.2.1 Activating monitoring²⁴⁾

The following parameters must be set to "Enabled" in SafeDESIGNER in order to enable safe encoder connection monitoring:

- "Encoder monitoring Position error monitoring Enable" = Enabled
- "Encoder monitoring Speed error monitoring Enable" = Enabled
- "Encoder monitoring Position setpoint alive testing (SPA) Enable" = Enabled

Danger!

In order to ensure safety-related monitoring of the encoder/motor connection, all three parameters "Encoder monitoring - Position error monitoring - Enable", "Encoder monitoring - Speed error monitoring - Enable" and "Encoder monitoring - Position setpoint alive testing (SPA) - Enable" must be set to "Enabled"!

If this is not the case, then the monitoring system cannot be used for safety purposes and a mechanical solution for detecting errors must be implemented!

5.4.2.2 Configuration rule for position lag error tolerance²⁵⁾

The position lag error tolerance must be set large enough to ensure availability. This can be done by first measuring the position lag error under the highest influence of disturbance variables and at maximum acceleration and then setting the position lag error tolerance accordingly higher.

Danger!

The position lag error tolerance is not permitted to be higher than half of one pole length!

If the safety function is activated, the size of the position lag error tolerance value affects how long it will take to look for errors and therefore also the error response time and estimation of the residual distance.

This must be taken into account by the machine manufacturer in the risk analysis!

Information:

Due to rounding errors, a reserve of 1 unit should be taken into account with the parameter "Encoder monitoring - Position error tolerance".

²⁴⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

²⁵⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

5.4.2.3 Configuration rule for speed error tolerance²⁶⁾

The speed error tolerance must be set large enough to ensure availability.

This can be done by first measuring the speed error under the highest influence of disturbance variables and reference variables (e.g. at maximum acceleration) and then setting the speed error tolerance accordingly higher.

Danger!

When the safety function is enabled, the size of the speed error tolerance value affects how long it will take to look for errors and therefore also the error response time and estimation of the residual distance.

This must be taken into account by the machine manufacturer in the risk analysis!

Information:

Due to rounding errors, a reserve of 1 unit/s should be taken into account with the parameter "Encoder monitoring - Speed error tolerance".

²⁶⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR_V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR, SF_oS_MOTION_ScaledSpeed_BR, SF_oS_MOTION_Position_BR.

5.5 Fault avoidance

Danger!

Validation

Each safety function that is used must be validated separately.

It is also necessary to test the entire safety application, including the interactions between individual functions.

5.5.1 Exceeding monitored limits

The SafeMOTION module monitors configurable limits. The drive itself, however, is controlled by the standard application on the standard PLC.

To prevent a violation of a monitored limit, the following points must be observed:

- The movement of the drive must be adapted to the requested safety function and initiated on time.
- The monitored limits must match the calculated limits and movement limitations. Make sure that the different configurations of the unit system match in the safety application and in the standard application!

Danger!

Any violation of a monitored limit will cause the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The "S_NotErrFUNC" output on the function block is reset, and the drive loses all torque/power and coasts to a stop!

Depending on the configuration, the motor holding brake will also be switched to 0 V.

In the event of an error, a synchronous axis will no longer be synchronous.

Check the Safety Logger in Automation Studio for detailed information about monitoring.

5.5.2 Plausibility error²⁷⁾

Plausibility errors (limit values, data types, variables/constants) that occur when using the function block are detected and reported by either the function block or compiler.

This is not possible in the event of connection errors, however.

The function block does not check for the following errors:

- Actual parameter values or constants are within their valid range but incorrect for the safety function being executed.
- · Actual parameters have been connected incorrectly.
- Formal input/output parameters that should have been connected have not been connected.

Danger!

Ensuring proper safety function connections (sub-application) is your responsibility as the user! Check the connections when validating the sub-application!

5.5.3 Sporadically changing/toggling signal levels or impermissible signals²⁸⁾

Sporadically changing or toggling signal levels on edge-controlled formal input parameters cause the function block to interpret this signal as an edge, which results in an unintended corresponding action being triggered in the function block if fault avoidance measures are not taken.

Sporadically changing or toggling signal levels on status-controlled input formal parameters will cause the signal to trigger an undesired corresponding action if error prevention measures are not taken.

Impermissible signals on input formal parameters can lead to an unexpected initial movement, non-execution of a requested action or an error message.

Possible causes of these signals:

²⁷⁾ This section applies to all function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF:

²⁸⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR, SF_SafeMC_BR, V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR

PLCopen Motion SF 2 • SF SafeMC BR V3

- Programming error in the application program (user error)
- · Cross fault, short circuit or open circuit (user error, wiring error)
- · Error on the standard controller

To prevent this, the following measures can be taken depending on the safety function:

- · Using signals from safe devices
- Implementing additional measures for preventing a hazard if using a signal from a standard controller (e.g. executing an additional function start after a safety function has been triggered or an error has been corrected)
- · Line control on the safe control system
- · Suitable cabling when using non-safe signals from the standard controller
- · Verifying the source code in the application program and final validation of the safety functionality

These measures can also be combined to prevent errors.

It is important to note that a signal change detected on a status-controlled formal parameter will be output as a diagnostic code.

5.5.4 Simultaneous edge change²⁹⁾

Make sure that the "Reset" formal parameter is only connected to a signal from a manual resetting device to reduce the risk of an unexpected initial movement. This signal is based on your risk analysis.

5.5.5 Machine/System startup without performing functional testing of protective equipment³⁰⁾

Faulty protective equipment is only detected following functional testing. Functional testing is not supported by this function block. If additional measures are not taken, faulty protective equipment can result in errors.

Danger!

You are responsible for the functional testing of protective equipment. You must therefore validate the protective equipment!

Possible causes of faulty protective equipment:

- Faulty devices (hardware error)
- · Cross fault, short circuit and open circuit (user error, wiring error)

²⁹⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_SafeMC_BR, SF_SafeMC_BR, V2, SF_SafeMC_BR_V3, SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_Ab-sPos_BR, SF_oS_MOTION_BR

³⁰⁾ This section applies to all function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF:

PLCopen_M tion_SF_2

5.6 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

5.6.1 General information about the "S_Request" inputs

The "S_Request" inputs are used to request the respective safety functions.

If a safety function should not be used in the safety application, then the respective input should not be connected.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

At a minimum, the "Activate" and "S_AxisID" inputs must be connected. Otherwise, the SafeMOTION module will not be operated by the SafeLOGIC controller. As a result, the pulse disabling and motor holding brake outputs will be permanently set to 0 V, which means that the controller cannot be turned on.

5.6.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.
All binary output parameters are set to FALSE.
Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

Chapter Chapter PLCopen_N tion_SF_3

5.6.3 S_RequestSTO

General function

· Selects/Deselects safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO safety function.

TRUE

The safety function is deselected. Safe pulse disabling is not active!

FALSE

The safety function is selected. Safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

• None

5.6.4 S_RequestSTO1

General function

· Selects/Deselects safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO1 safety function.

TRUE

The safety function is deselected. Safe pulse disabling is not active!

FALSE

The safety function is selected. Depending on the configuration, the high-side or low-side of safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	High-side/	Selects the high-si	High-side	R 1.3	
	Low-side Value High-side	Value	Description		
(previously Channel selection for One Channel STO (STO1))		High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 441: SafeMOTION parameter group: Basic functions - STO1

PLCopen_N tion_SF_

5.6.5 S_RequestSBC

General function

· Selects/Deselects safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SBC safety function.

TRUE

The safety function is deselected. The motor holding brake output is enabled and can be used by the standard application.

FALSE

The safety function is selected. The motor holding brake output is switched to 0 V!

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 442: SafeMOTION parameter group: Basic functions - SBC

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

5.6.6 S_RequestSOS

General function

· Selects/Deselects safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SOS safety function.

TRUE

The safety function is deselected. Standstill tolerances are not being monitored.

FALSE

The safety function is selected. Standstill tolerances are being monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(units/s)) Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 443: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The following application rule must be observed:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

 $LIM_{SOS} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} < EUS - Maximum speed to normalize speed range$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

5.6.7 S_RequestSS1

General function

· Selects/Deselects safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS1 safety function.

TRUE

The safety function is deselected. SS1 is not active!

FALSE

The safety function is selected. Safe pulse disabling is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 444: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descripti	ion	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled				R 1.3
		Value	Description		
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously Ramp Monitoring Time for SS1 (us))	[µs]	Deceleration ramp monitoring time for SS1		0	R 1.3

Table 445: SafeMOTION parameter group: Basic functions - SS1

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	Deceleration ramp below the lower lin "Early limit monitor falls below the end amount of time, the vated prematurely		R 1.3	
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[he]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 446: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

To use this function without safe encoder evaluation, "Ramp monitoring for SS1" and "Early Limit Monitoring" must be disabled.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

5.6.8 S_RequestSS2

General function

· Selects/Deselects safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS2 safety function.

TRUE

The safety function is deselected. SS2 is not active!

FALSE

The safety function is selected. Standstill monitoring is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 447: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
SS2 - Ramp monitoring - Enable	Enabled/ Disabled	Activates ramp monitoring (in addition to time-based monitoring) when the SS2 function is requested		Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ramp monitoring time for SS2		0	R 1.3

5.6.11 S_RequestSLS3

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 3

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS3 safety function.

TRUE

The safety function is deselected. SLS3 is not active!

FALSE

The safety function is selected. Speed limit 3 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 457: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description	Description D		Starting in Safety Release
SLS - Ramp monitoring - Enable	Enabled/ Disabled		-based monitoring (in addition to time-based monitoring) when on is requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)		Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS3 - Speed limit (previously Safe Speedlimit 3 for SLS (units/s))	[units/s]	Speed limit 3 fo	Speed limit 3 for SLS (SLS3)		R 1.3
SLS3 - Ramp monitoring - Time	[µs]	Deceleration ra	Deceleration ramp monitoring time for SLS3		R 1.3
(previously Ramp Monitoring Time for SLS3 (us))					

Table 458: SafeMOTION parameter group: Speed functions - SMS/SLS

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously Early Limit Monitoring)	Enabled/ Disabled	Deceleration ram below the lower li "Early limit monitor falls below the en amount of time, ti vated prematurely		R 1.3	
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 459: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

5.6.12 S_RequestSLS4

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 4

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS4 safety function.

TRUE

The safety function is deselected. SLS4 is not active!

FALSE

The safety function is selected. Speed limit 4 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 460: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SLS - Ramp monitoring - Enable	Enabled/ Disabled	Activates ramp-ba the SLS function is	sed monitoring (in addition to time-based monitoring) when s requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)		Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS4 - Speed limit (previously Safe Speedlimit 4 for SLS (units/s))	[units/s]	Speed limit 2 for S	SLS (SLS2)	0	R 1.3
SLS4 - Ramp monitoring - Time	[µs]	Deceleration ramp	monitoring time for SLS2	0	R 1.3

Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[he]		the speed must be below the target speed limit in order to ne deceleration ramp and to assume the safety function's		R 1.3

Table 462: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

5.6.13 S_RequestSLI

General function

· Selects/Deselects safety function Safely Limited Increment, SLI

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLI safety function.

TRUE

The safety function is deselected. SLI is not active!

FALSE

The safety function is selected. A safe range of increments is monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				

Table 463: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SLI (previously Safely Limited Increment)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLI - Position limit (previously Safe Increments (units))	[units]	Maximum movable increments when SLI is active	0	R 1.3
SLI - Disable delay time (previously <i>SLI Off Delay (µs)</i>)	[µs]	Switch off delay of SLI	0	R 1.3

Table 464: SafeMOTION parameter group: Advanced functions - SLI

Danger!

The maximum increment range must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

5.6.14 S_RequestSDIpos

General function

· Selects/Deselects safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the positive direction of movement.

TRUE

The safety function is deselected. SDI is not active!

FALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the positive direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 465: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 466: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

5.6.15 S_RequestSDIneg

General function

• Selects/Deselects safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the negative direction of movement.

TRUE

The safety function is deselected. SDI is not active!

FALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the negative direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 467: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 468: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

5.6.16 S_RequestSLA

General function

· Selects/Deselects safety function Safely Limited Acceleration, SLA

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLA safety function.

TRUE

The safety function is deselected. SLA is not active!

FALSE

The safety function is selected. A safe limit value for acceleration/deceleration is monitored with respect to the direction of movement.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 469: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Chapter / PLCopen_M

Group: Speed functions - SLA (previously Safely Limited Acceleration)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLA - Acceleration limit in positive direction	[units/s ²]	Limit value for acceleration in the positive direction of movement	0	R 1.9
(previously Safe acceleration limit for SLA (units/s²) in positive direction)				
SLA - Deceleration limit in positive direction	[units/s ²]	Limit value for deceleration in the positive direction of movement	0	R 1.9
(previously Safe deceleration limit for SLA (units/s²) in positive direction)				
SLA - Acceleration limit in negative direction	[units/s ²]	Limit value for acceleration in the negative direction of movement	0	R 1.9
(previously Safe acceleration limit for SLA (units/s²) in negative direction)				
SLA - Deceleration limit in negative direction	[units/s ²]	Limit value for deceleration in the negative direction of movement	0	R 1.9
(previously Safe deceleration limit for SLA (units/s²) in negative direction)				
SLA - Enable delay time	[µs]	Delay time between the SLA request and activation of the safety function	0	R 1.9
(previously Delay time to start SLA (us))				

Table 470: SafeMOTION parameter group: Speed functions - SLA

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

5.6.17 S_RequestSLP

General function

· Selects/Deselects safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLP safety function.

TRUE

The safety function is deselected. SLP is not active!

FALSE

The configured position window will be safety-monitored after "Delay time to start SLP (us)".

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 471: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLP - Lower position limit (previously Safe Lower Position Limit for SLP (units))	[units]	Lower position limit for the monitoring range	0	R 1.4
SLP - Upper position limit (previously Safe Upper Position Limit for SLP (units))	[units]	Upper position limit for the monitoring range	0	R 1.4
SLP - Enable delay time (previously <i>Delay time to start</i> SLP (us))	[µs]	Delay time between the SLP request and start of monitoring	0	R 1.4

Table 472: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 473: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The following application rule must be observed:

 $\mathsf{LIM}_{\mathsf{SMP},\mathsf{NEG}} \leq \mathsf{LIM}_{\mathsf{SLP},\mathsf{NEG}} \leq \mathsf{LIM}_{\mathsf{SLP},\mathsf{POS}} \leq \mathsf{LIM}_{\mathsf{SMP},\mathsf{POS}}$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

Information:

Safe homing of the axis must be completed prior to using this safety function.

If a homing procedure is not completed successfully or the "S_SafePositionValid" status changes, then the request for the SLP safety function causes the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. The output of function block "S_NotErrFUNC" is reset.

5.6.18 S_SwitchHomingMode

General function

• This input is used by safety function "Remanent Safe Position" and enables a homing procedure that confirms the remanent safe position.

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to switch between homing with RSP and the configured homing mode.

TRUE

When a homing command is given (i.e. positive edge of the "S_RequestHoming" input), then homing mode "Homing with RSP" is used.

FALSE

When a homing command is given (i.e. positive edge of the "S_RequestHoming" input), then the configured homing mode is used.

Relevant configuration parameters

	-		
Parameter	Unit	Description	Default value
Homing			
Remanent Safe Position	Enabled/ Disabled	Selects whether or not to use the remanent safe position	Disabled
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!	
Safety Standstill and Direction	Tolerances		
Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring	0
Position Tolerance	[units]	Position tolerance for standstill and direction monitoring	0

Table 474: RSP safety function - Parameters

5.6.19 S_RequestHoming

General function

· Selects/Deselects the "Safe Homing" safety function

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to start a "Safe Homing" procedure. A positive edge of the input starts the safety function.

Positive edge: Change from FALSE to TRUE

Starts "Safe Homing".

Negative edge: Change from TRUE to FALSE

If still active, the homing procedure will be terminated by the negative edge. This state transition has no effect if the homing procedure has already been completed.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Absolute position functions - Homing (previously Homing)

Parameter Unit		Description	Default value	Starting in Safety Release	
Homing - Mode (previously <i>Mode</i>)	Direct / Reference switch / Home Offset / Home offset with correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Direct	R 1.4	
Homing - Home position or home offset (previously Home Position or Home Offset (units))	[units]	Home position or home offset	0	R 1.4	
Homing - Enable RSP (Rema- nent safe position) (previously Remanent safe po- sition)	Enabled/ Disabled	Selects whether or not to use the remanent safe position This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.9	
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4	
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4	

Table 475: SafeMOTION parameter group: Absolute position functions - Homing

SafeMOTION User's Manual V 4.6.1

PLCopen_Motion_SF_2 • SF_SafeMC_BR_V3

Parameter	Unit	Description	Default value	Starting in Safety Release	
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.4	
Homing - Blocking distance (previously Blocking distance (% encoder reference system))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders. This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		R 1.4	
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4	
Homing - Monitoring time (previously <i>Homing Monitoring Time</i> (μs))	[µs]	Monitoring time for the homing procedure	0	R 1.4	

Table 475: SafeMOTION parameter group: Absolute position functions - Homing

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The Safe Homing function is needed in order to implement the safety functions SLP and SMP and for using the safe position.

The SafePositionValid status bit will remain set to SAFEFALSE until safe homing has been performed!

Chapter PLCopen_N tion_SF_

5.6.20 S ReferenceSwitch

General function

· Reference switch input for the "Safe Homing" safety function

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter serves as a reference switch input for the "Safe Homing" safety function and is only evaluated in the "Reference Switch" homing mode.

The status of a safe reference switch that was read into the safety application via a safe input module (X20SIxxxx), for example, should be linked to the input.

Not connected

The reference switch is not being used!

Information:

If "Reference Switch" homing mode is configured and the reference switch input "S_ReferenceSwitch" is not wired on the function block, then the SafeMOTION module will switch to the FAIL SAFE state. The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Information:

The "S_ReferenceSwitch" input is only evaluated in "Reference Switch" homing mode. The input is ignored in other homing modes!

5.6.21 Reset

General function

 "Reset" input for acknowledging the FUNCTIONAL FAIL SAFE state or for putting the SafeMOTION module into OPERATIONAL state after STARTUP

Data type

BOOL

Connection

Variable

Function description

"Reset" input to acknowledge the FUNCTIONAL FAIL SAFE state

A positive edge triggers the reset function.

Depending on the configuration of parameter "Automatic Reset at Startup", a positive edge may be necessary to get the SafeMOTION module from state INIT to state OPERATIONAL after startup.

Relevant configuration parameters

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
Automatic reset on start - En-	Enabled/	Activates automatic reset of the function block at startup		Disabled	R1.3
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)	Enabled	Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!	II I	
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 476: SafeMOTION parameter group: General settings - Automatic reset on start

Danger!

Parameter "Automatic reset on start" enables/disables the restart interlock during startup or when a network failure occurs on a reestablished network connection.

If parameter "Automatic reset on start" is set to "Enabled", then the module automatically changes to state OPERATIONAL state (i.e. pulse disabling and the motor holding brake are enabled)!

Configuring an automatic restart can result in critical safety conditions. Take additional measures to ensure proper safety-related functionality.

PLCopen_Mo

5.6.22 **S_AxisID**

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and the SF_SafeMC_BR or SF_SafeMC_BR_Vx function block in the safety application. Otherwise, it will not be possible to compile the safety application.

5.7 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

5.7.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

PLCopen_M tion_SF_2

5.7.2 S_SafetyActiveSTO

General function

· Status information for safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

· Variable

Function description

Indicates the functional safe state of the STO safety function

TRUE

The STO safety function is active and currently in its safe state.

FALSE

The STO safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.3 S_SafetyActiveSTO1

General function

· Status information for safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO1 safety function

TRUE

The STO1 safety function is active and currently in its safe state.

FALSE

The STO1 safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

5.7.4 S_SafetyActiveSBC

General function

· Status information for safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SBC safety function

TRUE

The SBC safety function is active and currently in its safe state.

FALSE

The SBC safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.5 S_SafetyActiveSOS

General function

· Status information for safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SOS safety function

TRUE

The SOS safety function is active and currently in its safe state.

FALSE

The SOS safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter 7 PLCopen_M tion_SF_2

5.7.6 S_SafetyActiveSS1

General function

· Status information for safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS1 safety function

TRUE

The SS1 safety function is active and currently in its safe state.

FALSE

The SS1 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.7 S_SafetyActiveSS2

General function

· Status information for safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS2 safety function

TRUE

The SS2 safety function is active and currently in its safe state.

FALSE

The SS2 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

5.7.8 S_SafetyActiveSLS1

General function

· Status information for safety function Safely Limited Speed, Speed Limit 1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS1 safety function

TRUE

The SLS1 safety function is active and currently in its safe state.

FALSE

The SLS1 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.9 S_SafetyActiveSLS2

General function

· Status information for safety function Safely Limited Speed, Speed Limit 2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS2 safety function

TRUE

The SLS2 safety function is active and currently in its safe state.

FALSE

The SLS2 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

5.7.10 S_SafetyActiveSLS3

General function

· Status information for safety function Safely Limited Speed, Speed Limit 3

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS3 safety function

TRUE

The SLS3 safety function is active and currently in its safe state.

FALSE

The SLS3 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.11 S_SafetyActiveSLS4

General function

· Status information for safety function Safely Limited Speed, Speed Limit 4

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS4 safety function

TRUE

The SLS4 safety function is active and currently in its safe state.

FALSE

The SLS4 safety function is not requested, has not yet achieved its safe state, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

5.7.12 S_SafetyActiveSLI

General function

· Status information for safety function Safely Limited Increment

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLI safety function

TRUE

The SLI safety function is active and currently in its safe state.

FALSE

The SLI safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.13 S_SafetyActiveSDIpos

General function

• Status information for safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIpos safety function

TRUE

The SDIpos safety function is active and currently in its safe state.

FALSE

The SDIpos safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

5.7.14 S_SafetyActiveSDIneg

General function

• Status information for safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIneg safety function

TRUE

The SDIneg safety function is active and currently in its safe state.

FALSE

The SDIneg safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.15 S_SafetyActiveSLA

General function

• Status information for the "Safely Limited Acceleration" (SLA) safety function

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLA safety function

TRUE

The SLA safety function is active and currently in its safe state.

FALSE

The SLA safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

Chapter / PLCopen_M tion_SF_2

5.7.16 S_SafetyActiveSLP

General function

· Status information for safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

· Variable

Function description

Indicates the functional safe state of the SLP safety function

TRUE

The SLP safety function is active and currently in its safe state.

FALSE

The SLP safety function is not requested, the function or the SafeMOTION module is currently in an error state or the function block has not been enabled.

5.7.17 S_SafetyActiveSMP

General function

· Status information for safety function Safe Maximum Position, SMP

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SMP safety function

TRUE

The SMP safety function is active and currently in its safe state.

FALSE

Monitoring of the SMP position limits is not active. Monitoring is not active because the SafeMOTION module has not yet been homed, the function or the SafeMOTION module is in an error state or the function block has not been enabled.

PLCopen_M tion_SF_2

5.7.18 S_ReqHominOK

General function

· Feedback for homing in SafeDESIGNER

Data type

SAFEBOOL

Connection

Variable

Function description

This status is set to provide feedback in the event that homing is requested when already in a homed state (**S_RequestHoming** and **S_SafePositionValid** are set).

TRUE

The input for homing is set (**S_RequestHoming** = SAFETRUE), and the safe position is valid (**S_SafePosition-Valid** = SAFETRUE).

FALSE

The input for homing is not set or the safe position is not valid.

5.7.19 S_SafePositionValid

General function

• Status information for the "Safe Homing" safety function and the safe position

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether or not safe homing of the axis has been completed and whether or not the position signal is valid.

TRUE

The axis has been safely homed, and the safe position is valid.

FALSE

The axis has not yet been safely homed, the axis encoder signal contains errors, the SafeMOTION module is in an error state or the function block has not been enabled. The safe position is invalid!

Danger!

The purpose of this signal is only to provide additional information.

"S_SafePositionValid" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of the output parameter "S_SafePosition" is only valid if the output parameter "S_SafePositionValid" is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

Chapter PLCopen_N tion_SF_3

5.7.20 S_SafetyActiveSDC

General function

· Information about the status of ramp monitoring

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the status of ramp monitoring.

TRUE

Ramp monitoring is active.

FALSE

Ramp monitoring is not active, the SafeMOTION module is currently in an error state or the function block has not been enabled.

Danger!

This signal should only be used for status information.

5.7.21 S_AIIReqFuncActive

General function

· Information about the status of the requested safety functions

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies the status of the requested safety functions.

TRUE

All requested safety functions are currently in their functional safe state.

FALSE

One or more safety functions have not yet achieved their safe state, the SafeMOTION module is in an error state or the function block has not been enabled.

Copen_Motion_SF_2

5.7.22 S_NotErrFUNC

General function

Information about the error state of the safe SafeMOTION module

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies the error state of the SafeMOTION module.

TRUE

No error was found on the SafeMOTION module.

FALSE

An error was detected on the SafeMOTION module (e.g. a monitored limit was exceeded), or the function block has not been enabled.

In the event of an error, see the Safety Logger in Automation Studio for additional information about the error. If the error is a functional error, then it can be acknowledged by changing the signal on input "Reset" from FALSE to TRUE (positive edge)!

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_NotErrFUNC" does not represent the functional safe state of the SafeMOTION module!

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

5.7.23 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on the "Reset" input must change from FALSE to TRUE (positive edge).

5.7.24 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

5.7.25 Diagnostic codes

Code (hex)	State	Description	Possible workaround
0000	IDLE	The function block is not active.	Enable the function block by setting "Activate" to TRUE.
8001	INIT		Configure parameter "Startreset" accordingly or change to a positive edge on input "Reset".
8002	OPERATIONAL	The SafeMOTION module is in the OPERATIONAL state. No safety function is selected. The SMS speed limit is monitored according to the configuration.	·
8003	WAIT FOR CONFIRMATION	The SafeMOTION module is in the internal OPERATION-AL state. At least one safety function has been requested and at least one safety function has not yet achieved its functional safe state. None of the limits currently being monitored have been violated.	·
8000	SAFE STATE	All requested safety functions have achieved their functional safe state. None of the limits currently being monitored have been violated.	·
C000	FUNCTIONAL FAIL SAFE	An error occurred!	Check the Safety Logger in Automation Studio. It will provide detailed information about the current error. Depending on the type of error, check the standard and/or safety application. For functional errors, check the configuration of the SafeMOTION module or replace the faulty SafeMOTION module.

Table 477: SF_SafeMC_BR(_V2, _V3): Diagnostic codes

5.7.26 AxisStatus

General function

· Diagnostics message from the function block, representation of the axis status bits in a DWORD

Data type

• DWORD

Connection

Variable

Function description

The **AxisStatus** output returns bit-coded information about the status of individual safety functions.

This information corresponds to a summary of the **S_xxx** outputs in a DWORD.

The individual bits have the following meaning:

Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
Status	Status	Status	Status	Status	Status	Status	Status
STO	SBC	SOS	SS1	SS2	SLS1	SLS2	SLS3
Bit 8	Bit 9	Bit 10	Bit 11	Bit 12	Bit 13	Bit 14	Bit 15
Status	Status	Status	Status	Status	Status	Status	Status
SLS4	STO1	SDI pos	SLI	SDI neg	SLP	SMP	PositionValid
Bit 16	Bit 17	Bit 18	Bit 19	Bit 20	Bit 21	Bit 22	Bit 23
Status SLA	Status Setposition Alive Test	Status SFR	Status "All requested safety functions active"	Status SDC	Status Operational	Status Not Encoder Error	Status Not Functional Er- ror

Table 478: SF_SafeMC_BR_V3: SafeMOTION module status bits

5.8 State machine

The state machine illustrated here is implemented on the SafeMOTION module.

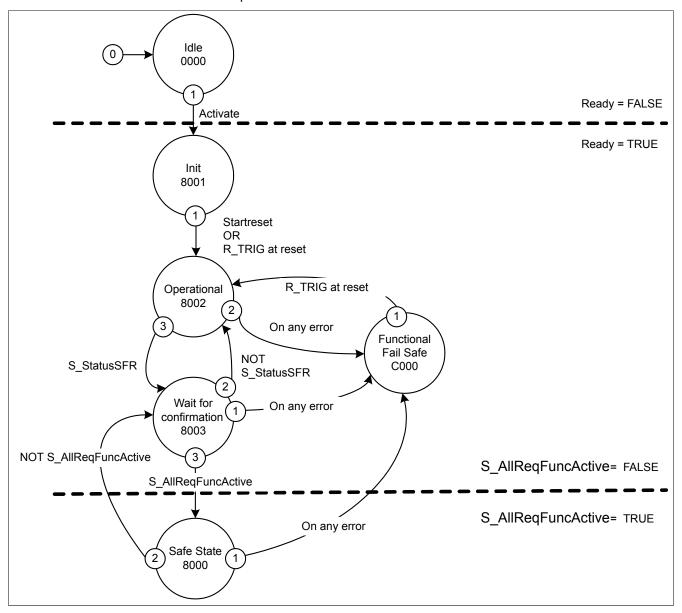

Figure 113: SF SafeMC BR(V2): State machine

Individual states are reflected by the "DiagCode" output parameter. In this way, the function block provides a representation of the state machine on the SafeMOTION module.

5.9 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

6 SF_SafeMC_Speed_BR

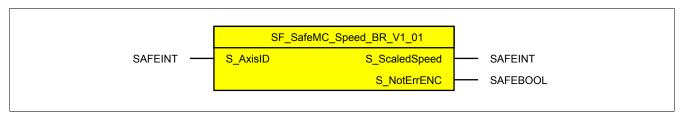

Figure 114: Function block SF SafeMC Speed BR

6.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type ¹⁾	Initial value	Description / General function
S AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 479: SF SafeMC Speed BR: Overview of input parameters

1) Evaluation of the input parameter signals in the function block. The signals must be controlled accordingly by the user.

Name	Туре	Connection	Signal type ¹⁾	Initial value	Description / General function
S_ScaledSpeed	SAFEINT	Variable	Value	-	Scaled safe speed
S_NotErrENC	SAFEBOOL	Variable	State	SAFEFALSE	No encoder error has been detected (=SAFETRUE), the signal S_ScaledSpeed is valid

Table 480: SF_SafeMC_Speed_BR: Overview of output parameters

1) Output of the output parameter signals. The signals must be evaluated and/or further processed accordingly by the user.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 481: Format description of the data types

6.2 Function

The primary purpose of function block SF_SafeMC_Speed_BR is to establish a connection between the safe speed of an axis and the associated encoder error status. An assignment is then made to a defined safe axis.

The SF_SafeMC_Speed_BR function block can be used to process the current safe speed of an axis in the safety application.

Danger!

Make sure that the correct AxisID is always used on the input! Each assignment must be validated separately.

To ensure valid evaluation of the speed signal, the corresponding encoder error status bit must also always be checked.

The speed signal itself is only considered valid if this output parameter is set to TRUE.

Danger!

If the speed signal is not validated, then an invalid speed value could be used in the safety application. This can result in hazardous situations!

6.3 Fault avoidance

Danger!

Validation

Each safety function that is used must be validated separately.

It is also necessary to test the entire safety application, including the interactions between individual functions.

6.3.1 Plausibility errors

Plausibility errors (limit values, data types, variables/constants) that occur when using the function block are detected and reported by the function block or compiler.

This is not always possible in the event of connection errors, however.

It is not possible for the function block to check whether:

- Actual parameter values or constants within the valid range are in fact incorrect for the safety functions being executed. A static TRUE signal on the Reset input is detected by the function block and indicated as an error, however.
- Actual parameters have been connected incorrectly.
- I/O formal parameters were not connected inadvertently.

It is therefore important to note the following:

Danger!

The user is responsible for the connection of the safety function (sub-application).

The connection for validating the sub-application must be checked

6.3.2 Validating the speed signal

In order for the speed signal to undergo a valid evaluation, the associated encoder error status bit must always be checked as well.

The speed signal itself is only considered valid if this output parameter is set to TRUE.

Danger!

If the speed signal is not validated, then an invalid speed value could be used in the safety application. This can result in hazardous situations!

6.3.3 Machine/System startup without performing functional testing of protective equipment

Faulty protective equipment is only detected following functional testing. Functional testing is not supported by this function block. If additional measures are not taken, faulty protective equipment can result in errors.

Danger!

You are responsible for the functional testing of protective equipment.

You must therefore validate the protective equipment!

Possible causes of faulty protective equipment:

- Faulty devices (hardware error)
- · Cross fault, short circuit and open circuit (user error, wiring error)

6.4 Input parameters

6.4.1 **S_AxisID**

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

The combination of AxisID and function block SF_SafeMC_Speed_BR is permitted to be used more than once in the safety application!

6.5 Output parameters

6.5.1 S_ScaledSpeed

General function

· Indicates the current value of the scaled safe speed

Data type

SAFEINT

Connection

Variable

Function description

This output parameter indicates the current value of the scaled safe speed for a real axis.

Danger!

The value of the "S_ScaledSpeed" output parameter is only valid if the "S_NotErrENC" output parameter is TRUE. Otherwise, it is invalid and is not permitted to be used further.

6.5.2 S_NotErrENC

General function

· Information about the error state of the safe encoder signal

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the error state of the signal for a defined safe encoder.

If an encoder error is detected or the SafeMOTION module is in an error state, then the output is set to FALSE. This state is maintained until the error has been corrected.

TRUE

An error was not detected on the encoder signal. The value of the safe speed on the output parameter "S_S-caledSpeed" is valid.

FALSE

The encoder signal from a defined safe axis is faulty, or the axis itself is in an error state. For more information about the error, see the Safety Logger in Automation Studio.

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_NotErrENC" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of the output parameter "S_ScaledSpeed" is only valid if the output parameter "S_NotErrENC" is TRUE. Otherwise, it is invalid and is not permitted to be used further.

6.6 Signal sequence diagram of the function block

A signal sequence diagram cannot be specified for this function block.

6.7 Application example

The following application example illustrates one possible comparison of the scaled safe speed with a permanent defined value in the safety application.

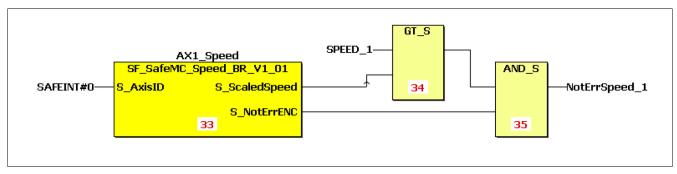

Figure 115: SF_SafeMC_Speed_BR: Evaluation of the scaled safe speed

7 SF_SafeMC_Position_BR

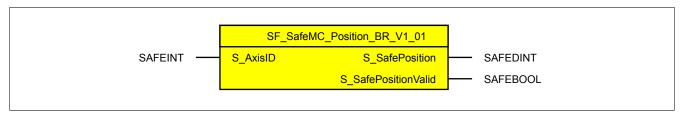

Figure 116: Function block SF SafeMC Position BR

Information:

The SF_SafeMC_Position_BR_V1_01 function block can only be used with Safety Release 1.4. If Safety Release 1.3 is being used, then SafeDESIGNER will return an error when compiling the safety application!

7.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 482: SF_SafeMC_Position_BR: Overview of input parameters

() Evaluation of the input parameter signals in the function block. The signals must be controlled accordingly by the user.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
S_SafePosition	SAFEDINT	Variable	Value	-	Safe position in units
S_SafePositionValid	SAFEBOOL	Variable	State		Specifies whether the safe position is valid (=SAFETRUE, homing procedure has completed successfully and there are no encoder errors)

Table 483: SF_SafeMC_Position_BR: Overview of output parameters

1) Output of the output parameter signals. The signals must be evaluated and/or further processed accordingly by the user.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 484: Format description of the data types

7.2 Function

The primary purpose of function block SF_SafeMC_Position_BR is to establish a connection between the safe position of an axis and its associated status. An assignment is then made to a defined safe axis.

The SF_SafeMC_Position_BR function block can be used to process the current safe position of an axis in the safety application.

Danger!

Make sure that the correct AxisID is always used on the input! Each assignment must be validated separately.

To ensure valid evaluation of the position signal, the corresponding status bit "S_PositionValid" must also always be checked.

The position itself is only considered homed and valid if this output parameter is set to SAFETRUE.

Danger!

If the position signal is not validated, then an invalid position could be used in the safety application. This can result in hazardous situations!

7.3 Fault avoidance

Danger!

Validation

Each safety function that is used must be validated separately.

It is also necessary to test the entire safety application, including the interactions between individual functions.

7.3.1 Plausibility errors

Plausibility errors (limit values, data types, variables/constants) that occur when using the function block are detected and reported by either the function block or compiler.

This is not possible in the event of connection errors, however.

The function block does not check for the following errors:

- Actual parameter values or constants are within their valid range but incorrect for the safety function being executed.
- Actual parameters have been connected incorrectly.
- · Formal input/output parameters that should have been connected have not been connected.

Danger!

Ensuring proper safety function connections (sub-application) is your responsibility as the user! Check the connections when validating the sub-application!

7.3.2 Validating the position signal

To ensure valid evaluation of the position signal, the corresponding status bit **S_PositionValid** must also always be checked.

The position itself is only considered homed and valid if this output parameter is set to SAFETRUE.

Danger!

If the position signal is not validated, then an invalid position could be used in the safety application. This can result in hazardous situations!

7.3.3 Machine/System startup without performing functional testing of protective equipment

Faulty protective equipment is only detected following functional testing. Functional testing is not supported by this function block. If additional measures are not taken, faulty protective equipment can result in errors.

Danger!

You are responsible for the functional testing of protective equipment.

You must therefore validate the protective equipment!

Possible causes of faulty protective equipment:

- Faulty devices (hardware error)
- · Cross fault, short circuit and open circuit (user error, wiring error)

PLCopen_Mction_SF_2

7.4 Input parameters

7.4.1 **S_AxisID**

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

The combination of AxisID and function block SF_SafeMC_Position_BR is permitted to be used more than once in the safety application!

7.5 Output parameters

7.5.1 S_SafePosition

General function

· Indicates the current safe position in units

Data type

SAFEDINT

Connection

Variable

Function description

This output parameter indicates the current value of the safe position for a real axis in units.

Danger!

The value of the output parameter "S_SafePosition" is only valid if the output parameter "S_SafePositionValid" is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

7.5.2 S_SafePositionValid

General function

• Status information for the "Safe Homing" safety function and the safe position

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether or not safe homing of the axis has been completed and whether or not the position signal is valid.

TRUE

The axis has been safely homed, and the safe position is valid.

FALSE

The axis has not yet been safely homed, the axis encoder signal contains errors, the SafeMOTION module is in an error state or the function block has not been enabled. The safe position is invalid!

Danger!

The purpose of this signal is only to provide additional information.

"S_SafePositionValid" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of the output parameter "S_SafePosition" is only valid if the output parameter "S_SafePositionValid" is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

7.6 Signal sequence diagram of the function block

A signal sequence diagram cannot be specified for this function block.

7.7 Application example

The following application example illustrates one possible use of the Safe Position Monitor function on the SafeL-OGIC controller.

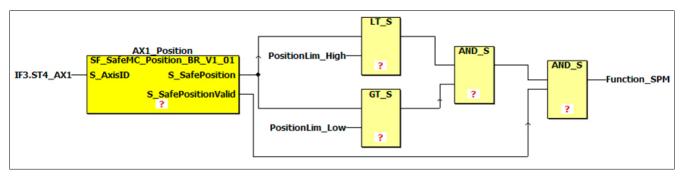

Figure 117: SF_SafeMC_Position_BR: The Safe Position Monitor function

8 SF_SafeMC_Position_BR_V2

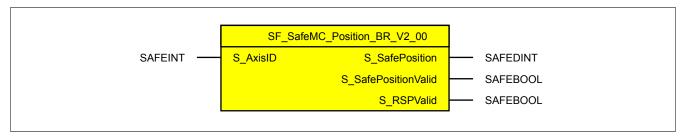

Figure 118: SF SafeMC Position BR V2 function block

Information:

The SF_SafeMC_Position_BR_V2 function block can only be used with Safety Release 1.9.

If a previous Safety Release is being used, then SafeDESIGNER will return an error when compiling the safety application!

8.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 485: SF SafeMC Position BR V2: Overview of input parameters

1) Evaluation of the input parameter signals in the function block. The signals must be controlled accordingly by the user.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
S_SafePosition	SAFEDINT	Variable	Value	-	Safe position in units
S_SafePositionValid	SAFEBOOL	Variable	State	SAFEFALSE	Specifies whether the safe position is valid (=SAFETRUE, homing procedure has completed successfully and there are no encoder errors)
S_RSPValid	SAFEBOOL	Variable	State	SAFEFALSE	Validates and stores the remanent safe position (TRUE = safe position is stored, power off for homing with RSP is now possible)

Table 486: SF_SafeMC_Position_BR_V2: Overview of output parameters

1) Output of the output parameter signals. The signals must be evaluated and/or further processed accordingly by the user.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 487: Format description of the data types

8.2 Function

The primary purpose of function block SF_SafeMC_Position_BR_V2 is to establish a connection between the safe position of an axis and its associated status. An assignment is then made to a defined safe axis.

The SF_SafeMC_Position_BR_V2 function block can be used to process the current safe position of an axis in the safety application.

Danger!

Make sure that the correct AxisID is always used on the input! Each assignment must be validated separately.

To ensure valid evaluation of the position signal, the corresponding status bit "S_PositionValid" must also always be checked.

The position itself is only considered homed and valid if this output parameter is set to SAFETRUE.

SafeMOTION User's Manual V 4.6.1

Danger!

If the position signal is not validated, then an invalid position could be used in the safety application. This can result in hazardous situations!

8.3 Fault avoidance

Danger!

Validation

Each safety function that is used must be validated separately.

It is also necessary to test the entire safety application, including the interactions between individual functions.

8.3.1 Plausibility error³¹⁾

Plausibility errors (limit values, data types, variables/constants) that occur when using the function block are detected and reported by either the function block or compiler.

This is not possible in the event of connection errors, however.

The function block does not check for the following errors:

- Actual parameter values or constants are within their valid range but incorrect for the safety function being executed.
- · Actual parameters have been connected incorrectly.
- · Formal input/output parameters that should have been connected have not been connected.

Danger!

Ensuring proper safety function connections (sub-application) is your responsibility as the user! Check the connections when validating the sub-application!

8.3.2 Validating the position signal

To ensure valid evaluation of the position signal, the corresponding status bit **S_PositionValid** must also always be checked.

The position itself is only considered homed and valid if this output parameter is set to SAFETRUE.

Danger!

If the position signal is not validated, then an invalid position could be used in the safety application. This can result in hazardous situations!

8.3.3 Machine/System startup without performing functional testing of protective equipment³²⁾

Faulty protective equipment is only detected following functional testing. Functional testing is not supported by this function block. If additional measures are not taken, faulty protective equipment can result in errors.

Danger!

You are responsible for the functional testing of protective equipment. You must therefore validate the protective equipment!

Possible causes of faulty protective equipment:

- Faulty devices (hardware error)
- · Cross fault, short circuit and open circuit (user error, wiring error)

8.4 Input parameters

8.4.1 **S_AxisID**

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

The combination of AxisID and function block SF_SafeMC_Position_BR is permitted to be used more than once in the safety application!

PLCopen_M tion_SF_2

8.5 Output parameters

8.5.1 S_SafePosition

General function

· Indicates the current safe position in units

Data type

SAFEDINT

Connection

Variable

Function description

This output parameter indicates the current value of the safe position for a real axis in units.

Danger!

The value of the output parameter "S_SafePosition" is only valid if the output parameter "S_SafePositionValid" is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

8.5.2 S_SafePositionValid

General function

• Status information for the "Safe Homing" safety function and the safe position

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether or not safe homing of the axis has been completed and whether or not the position signal is valid.

TRUE

The axis has been safely homed, and the safe position is valid.

FALSE

The axis has not yet been safely homed, the axis encoder signal contains errors, the SafeMOTION module is in an error state or the function block has not been enabled. The safe position is invalid!

Danger!

The purpose of this signal is only to provide additional information.

"S_SafePositionValid" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of the output parameter "S_SafePosition" is only valid if the output parameter "S_SafePositionValid" is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

Chapter / PLCopen_M tion_SF_2

8.5.3 S_RSPValid

General function

· Status information for the "Remanent safe position" safety function

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the following:

- · The current safe position has been homed, validated and saved.
- Changes to the safe position are prevented by the active STO and SOS safety functions.
- Powering off the module does not result in loss of the safe remanent position.

TRUE

The safe position has been saved successfully. Power off for homing with RSP is possible in this state.

FALSE

One or more of the following is true:

- The axis was not successfully homed. (The state of "S_SafePositionValid" is not TRUE.)
- The STO safety function is not selected/active.
- The SOS safety function is not selected/active.

8.6 Signal sequence diagram of the function block

A signal sequence diagram cannot be specified for this function block.

8.7 Application example

The following application example illustrates one possible use of the Safe Position Monitor function on the SafeL-OGIC controller.

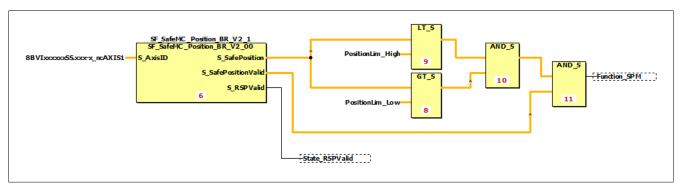

Figure 119: SF_SafeMC_Position_BR_V2: The "Safe Position Monitor" function

9 SF_SafeMC_SBT_BR

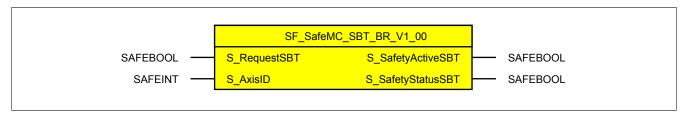

Figure 120: SF_SafeMC_SBT_BR function block

9.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type	Initial value	Description / General function
S_RequestSBT	SAFEBOOL	Variable/Constant	Edge	SAFEFALSE	Requests the SBT safety function on a negative edge
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 488: SF_SafeMC_SBT_BR: Overview of input parameters

Name	Туре	Connection	Signal type	Initial value	Description / General function
S_SafetyActiveSBT	SAFEBOOL	Variable	State	SAFEFALSE	SBT safety function active (= SAFETRUE)
S_SafetyStatusSBT	SAFEBOOL	Variable	State	SAFEFALSE	Safety function completed successfully, valid test status (= SAFETRUE)

Table 489: SF_SafeMC_SBT_BR: Overview of output parameters

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 490: Format description of the data types

9.2 Safe Brake Test (SBT)

See ACOPOSmulti SafeMOTION user's manual / Safety technology / Integrated safety functions / Safe Brake Test (SBT).

9.3 Fault avoidance

Danger!

Validation

Each safety function that is used must be validated separately.

It is also necessary to test the entire safety application, including the interactions between individual functions.

9.3.1 Plausibility error³³⁾

Plausibility errors (limit values, data types, variables/constants) that occur when using the function block are detected and reported by either the function block or compiler.

This is not possible in the event of connection errors, however.

The function block does not check for the following errors:

- Actual parameter values or constants are within their valid range but incorrect for the safety function being executed.
- Actual parameters have been connected incorrectly.
- Formal input/output parameters that should have been connected have not been connected.

Danger!

Ensuring proper safety function connections (sub-application) is your responsibility as the user! Check the connections when validating the sub-application!

9.3.2 Sporadically changing/toggling signal levels or impermissible signals

Sporadically changing/toggling signal levels or impermissible signals on

edge-controlled formal input parameters cause the function block to interpret the signal as an edge, which
results in an unintended action being triggered in the function block if error prevention measures are not
in place.

Possible causes of these signals:

- Programming error in the application program (user error)
- · Cross fault, short circuit or open circuit (user error, wiring error)
- · Error in the standard controller

To prevent this, the following measures can be taken depending on the safety function:

- · Use of safe device signals
- Implementing additional measures for preventing a hazard if using a signal from the standard controller (e.g. executing an additional function start after resetting a triggered safety function or correcting an error)
- · Line control on the safe control system.
- · Suitable wiring when using non-safe signals from the standard controller
- Verifying the source code in the application program and final validation of the safety functionality

The specified measures can also be combined to reliably avoid errors.

It is important to note that a signal change detected on a status-controlled formal parameter will be output as a diagnostic code.

PLCopen_Mi

9.4 Input parameters

9.4.1 S_RequestSBT

General function

· Selects/Deselects safety function Safe Brake Test, SBT

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to start the SBT safety function.

Negative edge

A negative edge or state transition from SafeTRUE to SafeFALSE on input parameter "S_RequestSBT" starts the Safe Brake Test, SBT safety function.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Parameter	Unit	Description	Default value
Safety Additional Parameters			
Delay time to start SBT (us)	[µs]	Delay time between the SBT request and activation of the safety function	0
Safe Brake Test			
Safe Brake Test interval (s)	[s]	Retry interval for the safe brake test	28800
Safe Brake Test threshold (uA)	[µA]	Threshold value for the stator current that must be exceeded during the brake test	0
Safe Brake Test external load (uA)	[µA]	External load	0
Safe Brake Test maximum torque duration (us)	[µs]	Duration of the test for which the maximum torque must be present	0
Safe Brake Test position tolerance (units)	[units]	Position tolerance	0

Table 491: SBT safety function - Parameters

9.4.2 **S_AxisID**

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and SF_SafeMC_SBT_BR in the safety application. Otherwise, it will not be possible to compile the safety application.

PLCopen_M tion_SF_2

9.5 Output parameters

9.5.1 S_SafetyActiveSBT

General function

· Status information for safety function Safe Brake Test, SBT

Data type

• SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SBT safety function

TRUE

The SBT safety function is being executed.

FALSE

The SBT safety function has not been requested.

9.5.2 S SafetyStatusSBT

General function

· Status information for testing the holding brake with Safe Brake Test, SBT

Data type

SAFEBOOL

Connection

Variable

Function description

Returns the status of the holding brake test with Safe Brake Test, SBT

TRUE

The SBT safety function has been executed. The status of the testing is valid.

FALSE

The SBT safety function has not been executed. The status of the testing is invalid or expired.

9.6 Signal sequence diagram

Signal sequence diagram for the Safe Brake Test, SBT safety function (see "ACOPOSmulti SafeMOTION user's manual / Safety technology / Integrated safety functions / Safe Brake Test, SBT").

10 Exceeding monitored limits³⁴⁾

The SafeMOTION module monitors configurable limits. The drive itself, however, is controlled by the standard application on the standard PLC.

To prevent a violation of a monitored limit, the following points must be observed:

- The movement of the drive must be adapted to the requested safety function and initiated on time.
- The monitored limits must match the calculated limits and movement limitations. Make sure that the different configurations of the unit system match in the safety application and in the standard application!

Danger!

Any violation of a monitored limit will cause the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Function block output "S_Status_NotErrFUNC" is reset, and the drive loses all torque/power and coasts to a stop.

Depending on the configuration, the motor holding brake will also be switched to 0 V.

In the event of an error, a synchronous axis will no longer be synchronous.

Check the Safety Logger in Automation Studio for detailed information about monitoring.

³⁴⁾ This section applies to the following function blocks in libraries PLCopen_MOTION_SF_2 and openSAFETY_BuR_Motion_SF: SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR, SF_oS_MOTION_AbsPos_BR, SF_oS_MOTION_BR.

Chapter 8 • openSAFETY_BuR_Motion_SF

Library openSAFETY_BuR_Motion_SF is the vendor-specific implementation of the openSAFETY Safe Movement profile specification for B&R.

All function blocks are equipped with the general connections defined in the PLCopen specification ("Activate", "Ready", "Error", "DiagCode").

Input "Activate" solely affects the functionality of the function block; outputs "Ready", "Error" and "DiagCode" are exclusively generated by the function block.

- · Input "Activate": Enables the function block
- · Output "Ready": Function block is being processed
- · Output "Error": Boolean error message
- Output "DiagCode": Error code

Connection "S_AxisID" references the axis to be used. This axis ID is made available as a constant by SafeDESIGNER.

All other connections correspond to the requirements or the status of the safety functions made available by the safe axis.

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR to be applied to each axis being used in the safety application. Otherwise, the internal state machine of the axis remains in state IDLE, and pulse disabling and the holding brake output cannot be enabled.

Alternatively, function block SF_oS_MOTION_BR can be used; it represents the combination of all available function sets.

Information:

Only the inputs of safety functions that are actually used in the safety application are permitted to be linked.

Linking an input of a safety function to SAFETRUE or SAFEFALSE is not permitted since this identifies the function as being used but does not allow it to be tested!

1 Overview

Overview of function blocks in library openSAFETY BuR Motion SF.

Function block	Description
SF_oS_MOTION_Basic_BR	Interface to the Basic Set of the openSAFETY Safe Motion profile
SF_oS_MOTION_Speed_BR	Interface to the Speed Extension Set of the openSAFETY Motion profile
SF_oS_MOTION_Advanced_BR	Interface to the Advanced Extension Set of the openSAFETY Motion profile
SF_oS_MOTION_AbsPos_BR	Interface to the Encoder Basic Set of the openSAFETY Motion profile
SF_oS_MOTION_BR	Combination of function blocks SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR and SF_oS_MOTION_AbsPos_BR
SF_oS_MOTION_ScaledSpeed_BR	Links the safe speed of an axis and the associated status of the encoder error
SF_oS_MOTION_Position_BR	Links the safe position of an axis and the associated status

openSAFE-

2 System requirements

Library "openSAFETY BuR Motion SF" is part of SafeDESIGNER and only permitted to be used there.

The following requirements must be met in order to use library "openSAFETY_BuR_Motion_SF":

- SafeDESIGNER: 4.2.2 or later
- Automation Studio: 4.2.5 or later
- · SafeLOGIC: Safety Release 1.10 or later
- SafeLOGIC-X: Safety Release 1.10 and later, X20(c)SLX910 supports maximum 1 axis
- ACP10 motion software: 3.15.0 or later
- The safety functions being used must be unlocked using a Technology Guard.

3 Term definitions

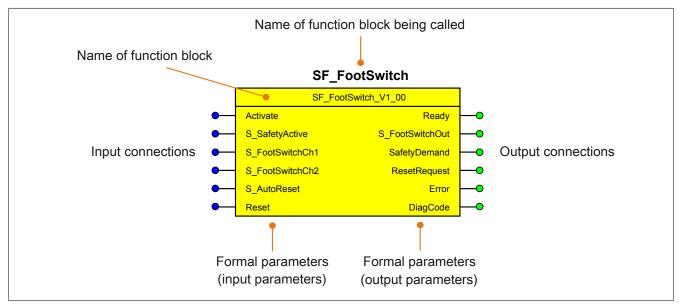

Figure 121: Components of a function block

When calling a function block, the inputs supply the input parameters with the current values of the variables or constants.

The output parameters supply the outputs with the associated values.

Inputs and outputs do not need to have the same name as the associated formal parameters, but they must be of the same data type. A difference in data type between formal parameters and inputs/outputs is reported as an error after compilation.

The name of a function block is composed of the function itself (e.g. "SF_FootSwitch", SF = safety function) and its version (Vx_yz). The format used to represent the version number in this document, Vx_yz , is a placeholder. For the actual version, see the function block being used.

4 SF_oS_MOTION_Basic_BR

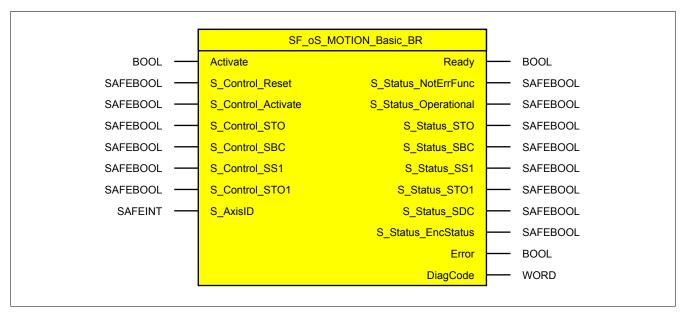

Figure 122: Function block SF_oS_MOTION_Basic_BR

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

4.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/ Constant	State	FALSE	Enables the function block (= TRUE) Input Activate according to the PLCopen standard
S_Control_Reset	SAFEBOOL	Variable/ Constant	Edge	SAFEFALSE	Resets error messages and the SafeMOTION module after the cause of the error has been removed
S_Control_Activate	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SAFETRUE: Starts the state machine of the safe axis, safety functions can be enabled. SAFEFALSE: Sets the state machine of the safe axis to state IDLE
S_Control_STO	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function "Safe Torque Off" (STO). SAFEFALSE: Safety function requested
S_Control_SBC	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function "Safe Brake Control" (SBC). SAFEFALSE: Safety function requested
S_Control_SS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function "Safe Stop 1" (SS1). SAFEFALSE: Safety function requested
S_Control_STO1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function "Safe Torque Off, One Chan- nel" (STO1). SAFEFALSE: Safety function requested
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 492: SF_oS_MOTION_Basic_BR: Overview of input parameters

Evaluation of the input parameter signals in the function block. The signals must be controlled accordingly by the user.

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_Basic_BR

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled Output Ready according to the PLCopen standard
S_Status_NotErrFunc	SAFEBOOL	Variable	State	SAFEFALSE	SafeMOTION module not in state FUNCTIONAL FAIL SAFE (i.e. SAFETRUE)
S_Status_Operational	SAFEBOOL	Variable	State	SAFEFALSE	Status of the state machine of the safe axis SAFEFALSE: State machine not in state OPERATION- AL SAFETRUE: State machine in state OPERATIONAL
S_Status_STO	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Torque Off" (STO) is active (i.e. SAFETRUE).
S_Status_SBC	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Brake Control" (SBC) is active (i.e. SAFETRUE).
S_Status_SS1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Stop 1" (SS1) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_STO1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Torque Off, One Channel" (STO1) is active (i.e. SAFETRUE).
S_Status_SDC	SAFEBOOL	Variable	State	SAFEFALSE	Deceleration monitoring is active (i.e. SAFETRUE).
S_Status_EncStatus	SAFEBOOL	Variable	State	SAFEFALSE	No encoder error has been detected (i.e. SAFETRUE), signal S_ScaledSpeed is valid.
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message

Table 493: SF_oS_MOTION_Basic_BR: Overview of output parameters

1) Output of the output parameter signals. The signals must be evaluated and/or further processed accordingly by the user.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 494: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

4.2 SafeMOTION module parameters

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit	Description I		Default value	Used Starting in Safety Release
Automatic reset on start - En-	Enabled/	Activates automati	Disabled	R1.3	
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 495: SafeMOTION parameter group: General settings - Automatic reset on start

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description		Default value	Starting in Safety Release
EUS - Count of physical reference system (previously Count of physical reference system)	-	Rotary encoder uni Linear encoder uni the physical referent Any unit (mm, 1/10 positions (and data For this reason, the per x revolutions / x references	1	R 1.4	
EUS - Units per count of physical reference system (previously <i>Units per count of physical reference system [units]</i>)	[units]	Linear encoder uni Any unit (mm, 1/10 positions (and data For this reason, the per x revolutions /	it scale: Units per x revolutions t scale: Units per x reference lengths 00 mm, 1/20 inch, degree of angle, etc.) can be used for a that can result such as speed and acceleration). a relationship between an integer multiple of this unit (units units per x reference lengths) and a certain number of x rence lengths has to be previously defined.	1000	R 1.4
EUS - Counting direction	Standard /		of the position or speed	Default	R 1.3
(previously Counting direction)	Inverse	Default Inverse	Description Encoder counting direction is equal to the counting direction of the unit system. Encoder counting direction is negative to the counting direction of the unit system.		
EUS - Length of physical ref- erence system for linear en- coder (previously Length of physical reference system for linear en- coder (nm))	[nm]	is defined here.	ment systems, the length of a physical reference system sed for rotary encoders, where the reference system is a	100000000	R 1.4
EUS - Maximum speed to nor- malize speed range (previously Maximum speed to normalize the speed range (units/s))	[units/s]	Maximum speed to	which the displayed speed should be normalized	32767	R 1.3
EUS - Encoder acceleration limit (previously Maximum acceler- ation (rad/s² or mm/s²))	[rad/s²] or [mm/s²]	Maximum permissi	ble encoder acceleration	100000	R 1.4

Table 496: SafeMOTION parameter group: General settings - Encoder Unit System

Group: General settings - Encoder monitoring (previously *Encoder Monitoring*)

Parameter	Unit	Description		Default value	Starting in Safety Release
Encoder monitoring - Safe En-		Status of the proof	f of fatigue strength of the encoder mounting	From motor data	R1.10
coder Mounting (Hardware up-	record / Approved	Value Description		record	
grade 1.10.3.x and later)	by user	From motor data record	The status of the encoder mounting is determined using the motor data record.		
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.		
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the dule	Enabled	R1.3
		Value	Description		
(previously Encoder Position		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active

See 3.4 "Fault avoidance" on page 497.

openSAFE-TY_BuR_Motion_3

4.6 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

4.6.1 General information about "S_Control" inputs

"S_Control" inputs are used to request the respective safety functions.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

To enable the function block itself and assign the functions to a defined axis, inputs "Activate" and "S AxisID" must be connected at a minimum.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR (or alternatively, function block SF_oS_MOTION_BR) to be applied to each axis being used in the safety application.

In addition to inputs "Activate" and "S_AxisID", inputs "S_Control_Reset" and "S_Control_Activate" must also be used. Otherwise, the SafeDESIGNER project cannot be compiled.

4.6.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.
All binary output parameters are set to FALSE.
Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

General function

 Input "S_Control_Reset" for acknowledging state FUNCTIONAL FAIL SAFE or for putting the SafeMOTION module into state OPERATIONAL after STARTUP

Data type

SAFEBOOL

Connection

Variable

Function description

Input "S_Control_Reset" for acknowledging the FUNCTIONAL FAIL SAFE state

A positive edge triggers the reset function.

Depending on the configuration of parameter "Automatic Reset at Startup", a positive edge may be necessary to get the SafeMOTION module from state INIT to state OPERATIONAL after startup.

Relevant configuration parameters

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
Automatic reset on start - En-	Enabled/	Activates automatic reset of the function block at startup		Disabled	R1.3
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 504: SafeMOTION parameter group: General settings - Automatic reset on start

Danger!

Parameter "Automatic reset on start" enables/disables the restart interlock during startup or when a network failure occurs on a reestablished network connection.

If parameter "Automatic reset on start" is set to "Enabled", then the module automatically changes to state OPERATIONAL state (i.e. pulse disabling and the motor holding brake are enabled)!

Configuring an automatic restart can result in critical safety conditions. Take additional measures to ensure proper safety-related functionality.

openSAFE-TY_BuR_Motion_SF

4.6.4 S_Control_Activate

General function

• Enables the module-internal state machine for a safe axis on the SafeMOTION module to execute the selected safety function

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to enable the module-internal state machine for a safe axis on the SafeMOTION module to execute the selected safety function.

SAFETRUE

Starts the state machine of the safe axis, safety functions can be enabled.

SAFEFALSE

Sets the state machine of the safe axis to state IDLE

openSAFE-TY_BuR_Motion_3

4.6.5 S_Control_STO

General function

· Selects/Deselects safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO safety function.

SAFETRUE

The safety function is deselected. Safe pulse disabling is not active!

SAFEFALSE

The safety function is selected. Safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

• None

4.6.6 S_Control_SBC

General function

· Selects/Deselects safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SBC safety function.

SAFETRUE

The safety function is deselected. The motor holding brake output is enabled and can be used by the standard application.

SAFEFALSE

The safety function is selected. The motor holding brake output is switched to 0 V!

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 505: SafeMOTION parameter group: Basic functions - SBC

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

General function

· Selects/Deselects safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS1 safety function.

SAFETRUE

The safety function is deselected. SS1 is not active!

SAFEFALSE

The safety function is selected. Safe pulse disabling is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp [units/s ²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 506: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

openSAFE-TY_BuR_Motion_SF

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descripti	on	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Activates ramp-based monitoring (in Disabled addition to time-based monitoring) when the SS1 function is requested		Enabled	R 1.3	
		Value	Description		
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously Ramp Monitoring Time for SS1 (us))	[he]	Decelerat SS1	ion ramp monitoring time for	0	R 1.3

Table 507: SafeMOTION parameter group: Basic functions - SS1

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	Deceleration ramp monitoring is terminated prematurely if the value falls below the lower limit "Early limit monitoring": If the current speed during the deceleration process falls below the end speed limit of the activated safety function for a defined amount of time, then the safe state of the respective function will be activated prematurely. Value			R 1.3
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 508: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

To use this function without safe encoder evaluation, "Ramp monitoring for SS1" and "Early Limit Monitoring" must be disabled.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \leq LIM_{SLS4} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} < EUS - Maximum speed to normalize speed range$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

4.6.8 S_Control_STO1

General function

· Selects/Deselects safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO1 safety function.

SAFETRUE

The safety function is deselected. Safe pulse disabling is not active!

SAFEFALSE

The safety function is selected. Depending on the configuration, the high-side or low-side of safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	High-side/	Selects the high-side or low-side IGBT in the STO1 function		High-side	R 1.3
	Low-side	Value	Description		
(previously Channel selection for One Channel STO (STO1))		High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 509: SafeMOTION parameter group: Basic functions - STO1

4.6.9 **S_AxisID**

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and function block oS_MOTION_Basic_BR or oS_MOTION_BR in the safety application. Otherwise, it will not be possible to compile the safety application.

openSAFE-TY_BuR_Motion_3

4.7 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

4.7.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

4.7.2 S_Status_NotErrFunc

General function

Information about the error state of the safe axis of the SafeMOTION module

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies the error state of the safe axis of the SafeMOTION module.

SAFETRUE

No error was found on the SafeMOTION module.

SAFEFALSE

An error (e.g. exceeding a monitored limit) has been detected on the safe axis of the SafeMOTION module or the function block has not been activated.

In the event of an error, see the Safety Logger in Automation Studio for additional information about the error. If the error is a functional error, then it can be acknowledged by changing the signal on input "S_Control_Reset" from SAFEFALSE to SAFETRUE (positive edge)!

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_Status_NotErrFUNC" does not represent the functional safe state of the SafeMOTION module!

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

openSAFE-TY_BuR_Motion_S

4.7.3 S_Status_Operational

General function

· Information about the status of the state machine of the safe axis

Data type

SAFEBOOL

Connection

· Variable

Function description

This output parameter specifies the status of the state machine of the safe axis.

SAFETRUE

The state machine is in state OPERATIONAL.

SAFEFALSE

The state machine is not in state OPERATIONAL.

4.7.4 S_Status_STO

General function

· Status information for safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO safety function

SAFETRUE

The STO safety function is active and currently in its safe state.

SAFEFALSE

openSAFE-

4.7.5 S_Status_SBC

General function

· Status information for safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SBC safety function

SAFETRUE

The SBC safety function is active and currently in its safe state.

SAFEFALSE

4.7.6 S_Status_SS1

General function

· Status information for safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS1 safety function

SAFETRUE

The SS1 safety function is active and currently in its safe state.

SAFFFALSE

openSAFE-

4.7.7 S_Status_STO1

General function

· Status information for safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO1 safety function

SAFETRUE

The STO1 safety function is active and currently in its safe state.

SAFEFALSE

4.7.8 S_Status_SDC

General function

· Information about the status of ramp monitoring

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the status of ramp monitoring.

SAFETRUE

Ramp monitoring is active.

SAFEFALSE

Ramp monitoring is not active. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

Danger!

This signal should only be used for status information.

openSAFE-TY_BuR_Motion_3

4.7.9 S_Status_EncStatus

General function

· Information about the error state of the safe encoder signal

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the error state of the signal for a defined safe encoder.

If an encoder error is detected or the SafeMOTION module is in an error state, then the output is set to SAFEFALSE. This state is maintained until the error has been corrected.

SAFETRUE

An error was not detected on the encoder signal.

SAFEFALSE

The encoder signal from a defined safe axis is faulty, or the axis itself is in an error state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled. For more information about the error, see the Safety Logger in Automation Studio.

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_Status_EncStatus" does not represent the functional safe state of the SafeMOTION module!

4.7.10 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on input "S_Control_Reset" must change from SAFE-FALSE to SAFETRUE (positive edge).

openSAFE-TY_BuR_Motion_8

4.7.11 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages ($0xxx_{hex}$, $8xxx_{hex}$), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

4.7.12 Overview of diagnostic codes

Diagnostic codes

Code (hex)	Description	Corrective measures
0000	The function block is not enabled. If "Activate" is connected to a variable that indicates the state of the connected safe device (active, inactive or peripheral fault detected), then the safe device is not active or has detected a fault in the connected peripheral.	 Enable the function block by setting "Activate" to SAFETRUE. Enable the safe device if "Activate" is connected to a variable that indicates the state of a connected safe device (active, inactive or peripheral fault detected), or correct the fault in the peripheral according to the device description.
8000	The function block detected neither a status nor an error to set the enable output to SAFEFALSE.	 If this is a desired signal combination at the signal inputs, no action is required. If the signal combination on the signal inputs is unintended,
C001	The function set for the control byte was not found.	check the connected peripheral and correct any faults. Check whether the required safety function is supported by the connected axis.
C002	The function set for the status byte was not found.	Check whether the required safety function is supported by the connected axis.
C003	The function set ID that was read does not match.	Check whether the required safety function is supported by the connected axis.
C004	The data length of the function set that was read is invalid.	Check whether the required safety function is supported by the connected axis.
C005	The status byte could not be read.	Check whether the required safety function is supported by the connected axis.
C006	The control byte could not be written.	Check whether the required safety function is supported by the connected axis.

Table 510: SF_oS_MOTION_(Basic, Speed, Advanced, AbsPos)_BR: Diagnostic codes

4.8 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

5 SF_oS_MOTION_Speed_BR

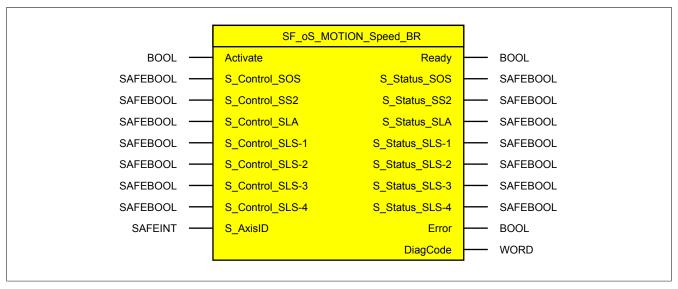

Figure 123: Function block SF_oS_MOTION_Speed_BR

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR to be applied to each axis being used in the safety application. Otherwise, the internal state machine of the axis remains in state IDLE, and pulse disabling and the holding brake output cannot be enabled.

Alternatively, function block SF_oS_MOTION_BR can be used; it represents the combination of all available function sets.

5.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/ Constant	Status	FALSE	Enables the function block (= TRUE) Input "Activate" according to the PLCopen standard
S_Control_SOS	SAFEBOOL	Variable/ Constant	Status	SAFEFALSE	Request for safety function Safe Operating Stop (SOS). SAFEFALSE: Safety function requested
S_Control_SS2	SAFEBOOL	Variable/ Constant	Status	SAFEFALSE	Request for safety function Safe Stop 2 (SS2). SAFEFALSE: Safety function requested
S_Control_SLA	SAFEBOOL	Variable/ Constant	Status	SAFEFALSE	Request for safety function Safely Limited Acceleration (SLA). SAFEFALSE: Safety function requested
S_Control_SLS-1	SAFEBOOL	Variable/ Constant	Status	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 1 (SLS-1). SAFEFALSE: Safety function requested
S_Control_SLS-2	SAFEBOOL	Variable/ Constant	Status	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 2 (SLS-2). SAFEFALSE: Safety function requested
S_Control_SLS-3	SAFEBOOL	Variable/ Constant	Status	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 3 (SLS-3). SAFEFALSE: Safety function requested
S_Control_SLS-4	SAFEBOOL	Variable/ Constant	Status	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 4 (SLS-4). SAFEFALSE: Safety function requested
S_AxisID	SAFEINT	Constant	Status	-1	Assigns an axis to the function block

Table 511: SF_oS_MOTION_Speed_BR: Overview of input parameters

¹⁾ Evaluation of the input parameter signals in the function block. You must control the signals accordingly.

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_Speed_BR

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	Status	FALSE	Indicates that the function block is enabled Output Ready according to the PLCopen standard
S_Status_SOS	SAFEBOOL	Variable	Status	SAFEFALSE	Safety function "Safe Operating Stop" (SOS) active, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SS2	SAFEBOOL	Variable	Status	SAFEFALSE	Safety function "Safe Stop 2" (SS2) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLA	SAFEBOOL	Variable	Status	SAFEFALSE	Safety function "Safely Limited Acceleration" (SLA) active, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-1	SAFEBOOL	Variable	Status	SAFEFALSE	Safety function "Safely Limited Speed, Speed Limit 1" (SLS-1) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-2	SAFEBOOL	Variable	Status	SAFEFALSE	Safety function "Safety Limited Speed, Speed Limit 2" (SLS-2) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-3	SAFEBOOL	Variable	Status	SAFEFALSE	Safety function "Safely Limited Speed, Speed Limit 3" (SLS-3) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-4	SAFEBOOL	Variable	Status	SAFEFALSE	Safety function "Safely Limited Speed, Speed Limit 4" (SLS-4) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
Error	BOOL	Variable	Status	FALSE	Function block error message
DiagCode	WORD	Variable	Status	16#0000	Function block diagnostic message

Table 512: SF_oS_MOTION_Speed_BR: Overview of output parameters

1) Output of the output parameter signals. You must evaluate and/or further process the signals accordingly.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 513: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

5.2 SafeMOTION module parameters

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
SS2 - Ramp monitoring - Enable			Activates ramp monitoring (in addition to time-based monitoring) when the SS2 function is requested		
		Value	Description		
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ramp monitoring time for SS2		0	R 1.3

Table 514: SafeMOTION parameter group: Speed functions - SS2

Group: Speed functions - SLA (previously Safely Limited Acceleration)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLA - Acceleration limit in pos- itive direction (previously Safe acceleration limit for SLA (units/s²) in posi- tive direction)	[units/s²]	Limit value for acceleration in the positive direction of movement	0	R 1.9
SLA - Deceleration limit in positive direction (previously Safe deceleration limit for SLA (units/s²) in posi- tive direction)	[units/s²]	Limit value for deceleration in the positive direction of movement	0	R 1.9
SLA - Acceleration limit in negative direction (previously Safe acceleration limit for SLA (units/s²) in nega- tive direction)	[units/s²]	Limit value for acceleration in the negative direction of movement	0	R 1.9
SLA - Deceleration limit in negative direction (previously Safe deceleration limit for SLA (units/s²) in nega- tive direction)	[units/s²]	Limit value for deceleration in the negative direction of movement	0	R 1.9
SLA - Enable delay time (previously <i>Delay time to start</i> <i>SLA</i> (<i>us</i>))	[µs]	Delay time between the SLA request and activation of the safety function	0	R 1.9

Table 515: SafeMOTION parameter group: Speed functions - SLA

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SMS - Enable	Enabled/	Activates the SM	IS safety function by configuration	Enabled	R 1.3
	Disabled	Value	Description		
(previously Safe Maximum		Enabled	SMS activated		
Speed)		Disabled	SMS deactivated		
SMS - Speed limit (previously Maximum Speed for SMS (units/s))	[units/s]	Speed limit of the	Speed limit of the maximum speed (SMS)		R 1.3
SLS1 - Speed limit (previously Safe Speedlimit 1 for SLS (units/s))	[units/s]	Speed limit 1 for	SLS (SLS1)	0	R 1.3
SLS2 - Speed limit (previously Safe Speedlimit 2 for SLS (units/s))	[units/s]	Speed limit 2 for	SLS (SLS2)	0	R 1.3
SLS3 - Speed limit (previously Safe Speedlimit 3 for SLS (units/s))	[units/s]	Speed limit 3 for	SLS (SLS3)	0	R 1.3

Table 516: SafeMOTION parameter group: Speed functions - SMS/SLS

SafeMOTION User's Manual V 4.6.1

Parameter	Unit	Description		Default value	Starting in Safety Release
SLS4 - Speed limit (previously Safe Speedlimit 4 for SLS (units/s))	[units/s]	Speed limit 4 for SLS (SLS4) 0		0	R 1.3
SLS - Ramp monitoring - Enable	Enabled/ Disabled		b-based monitoring (in addition to time-based monitoring) when on is requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)		Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS1 - Ramp monitoring - Time	[µs]	Deceleration ramp monitoring time for SLS1		0	R 1.3
(previously Ramp Monitoring Time for SLS1 (us))					
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ra	amp monitoring time for SLS2	0	R 1.3
(previously Ramp Monitoring Time for SLS2 (us))					
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ramp monitoring time for SLS3		0	R 1.3
(previously Ramp Monitoring Time for SLS3 (us))					
SLS4 - Ramp monitoring - Time	[µs]	Deceleration ramp monitoring time for SLS4		0	R 1.3
(previously Ramp Monitoring Time for SLS4 (us))					

Table 516: SafeMOTION parameter group: Speed functions - SMS/SLS

Danger!

The respective monitored speed limit must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous speed cannot be exceeded in the event of error.

The dangerous speed must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $\mathsf{LIM}_{\mathsf{SOS}} \leq \mathsf{LIM}_{\mathsf{SLS4}} \leq \mathsf{LIM}_{\mathsf{SLS3}} \leq \mathsf{LIM}_{\mathsf{SLS2}} \leq \mathsf{LIM}_{\mathsf{SLS1}} \leq \mathsf{LIM}_{\mathsf{SMS}} \leq \mathsf{EUS} \text{ - Maximum speed to normalize speed range}$

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

The following application rule must be observed:

 $LIM_{SOS} \leq LIM_{SLS4} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} \leq EUS - Maximum \ speed \ to \ normalize \ speed \ range$

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

openSAFE-Y_BuR_Motion_S

5.3 Integrated safety functions

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

5.4 Safe encoder connection

See 2.3.3 "Safe encoder connection" on page 304.

5.5 Fault avoidance

See 3.4 "Fault avoidance" on page 497.

5.6 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

5.6.1 General information about "S_Control" inputs

"S_Control" inputs are used to request the respective safety functions.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

To enable the function block itself and assign the functions to a defined axis, inputs "Activate" and "S AxisID" must be connected at a minimum.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR (or alternatively, function block SF_oS_MOTION_BR) to be applied to each axis being used in the safety application.

openSAFE-TY_BuR_Motion_3

5.6.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.
All binary output parameters are set to FALSE.
Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

5.6.3 S_Control_SOS

General function

· Selects/Deselects safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SOS safety function.

SAFETRUE

The safety function is deselected. Standstill tolerances are not being monitored.

SAFFFALSE

The safety function is selected. Standstill tolerances are being monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance (units</i>))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 517: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

openSAFE-

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \leq LIM_{SLS4} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} < EUS - Maximum speed to normalize speed range$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

5.6.4 S_Control_SS2

General function

· Selects/Deselects safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS2 safety function.

SAFETRUE

The safety function is deselected. SS2 is not active!

SAFEFALSE

The safety function is selected. Standstill monitoring is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s ²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 518: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit			Default value	Starting in Safety Release
SS2 - Ramp monitoring - Enable			Activates ramp monitoring (in addition to time-based monitoring) when the SS2 function is requested		R 1.3
		Value	Description		
(previously Rampmonitoring for SS2)		Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ramp monitoring time for SS2		0	R 1.3

Table 519: SafeMOTION parameter group: Speed functions - SS2

openSAFE-TY_BuR_Motion_SF

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(units/s)) Standstill monitoring - Position tolerance (previously Position Tolerance (units))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 520: SafeMOTION parameter group: General settings - Standstill monitoring

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable	Enabled/ Disabled	Deceleration ramp	Disabled	R 1.3	
(previously Early Limit Moni- toring)		"Early limit monitor falls below the end amount of time, the vated prematurely			
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state			R 1.3

Table 521: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS4} \le LIM_{SLS2} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} < EUS$ - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

5.6.5 S_Control_SLA

General function

· Selects/Deselects safety function Safely Limited Acceleration, SLA

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLA safety function.

SAFETRUE

The safety function is deselected. SLA is not active!

SAFEFALSE

The safety function is selected. A safe limit value for acceleration/deceleration is monitored with respect to the direction of movement.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 522: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

openSAFE-TY_BuR_Motion_S

Group: Speed functions - SLA (previously Safely Limited Acceleration)

Parameter	Unit	Description	Default value	Starting in Safety Release

Table 535: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS4} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} < EUS$ - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

5.6.10 S_AxisID

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and function block oS_MOTION_Basic_BR or oS_MOTION_BR in the safety application. Otherwise, it will not be possible to compile the safety application.

openSAFE-TY_BuR_Motion_8

5.7 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

5.7.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

5.7.2 S_Status_SOS

General function

· Status information for safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SOS safety function

SAFETRUE

The SOS safety function is active and currently in its safe state.

SAFEFALSE

openSAFE-

5.7.3 **S_Status_SS2**

General function

• Status information for safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS2 safety function

SAFETRUE

The SS2 safety function is active and currently in its safe state.

SAFEFALSE

5.7.4 S_Status_SLA

General function

· Status information for safety function Safely Limited Acceleration, SLA

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLA safety function

SAFETRUE

The SLA safety function is active and currently in its safe state.

SAFFFALSE

openSAFE-

5.7.5 S_Status_SLS-1

General function

· Status information for safety function Safely Limited Speed, Speed Limit 1 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS1 safety function

SAFETRUE

The SLS1 safety function is active and currently in its safe state.

SAFEFALSE

5.7.6 S_Status_SLS-2

General function

· Status information for safety function Safely Limited Speed, Speed Limit 2 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS2 safety function

SAFETRUE

The SLS2 safety function is active and currently in its safe state.

SAFFFALSE

openSAFE-Y_BuR_Motion_S

5.7.7 S_Status_SLS-3

General function

• Status information for safety function Safely Limited Speed, Speed Limit 3 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS3 safety function

SAFETRUE

The SLS3 safety function is active and currently in its safe state.

SAFEFALSE

5.7.8 S_Status_SLS-4

General function

• Status information for safety function Safely Limited Speed, Speed Limit 4 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS4 safety function

SAFETRUE

The SLS4 safety function is active and currently in its safe state.

SAFFFALSE

openSAFE-Y_BuR_Motion_S

5.7.9 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on input "S_Control_Reset" must change from SAFE-FALSE to SAFETRUE (positive edge).

5.7.10 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

5.7.11 Overview of diagnostic codes

Diagnostic codes

Code (hex)	Description	Corrective measures
0000	The function block is not enabled.	Enable the function block by setting "Activate" to SAFETRUE.
	If "Activate" is connected to a variable that indicates the state of the connected safe device (active, inactive or peripheral fault detected), then the safe device is not active or has detected a fault in the connected peripheral.	 Enable the safe device if "Activate" is connected to a variable that indicates the state of a connected safe device (active, inactive or peripheral fault detected), or correct the fault in the peripheral according to the device description.
8000	The function block detected neither a status nor an error to set the enable output to SAFEFALSE.	 If this is a desired signal combination at the signal inputs, no action is required.
		 If the signal combination on the signal inputs is unintended, check the connected peripheral and correct any faults.
C001	The function set for the control byte was not found.	Check whether the required safety function is supported by the connected axis.
C002	The function set for the status byte was not found.	Check whether the required safety function is supported by the connected axis.
C003	The function set ID that was read does not match.	Check whether the required safety function is supported by the connected axis.
C004	The data length of the function set that was read is invalid.	Check whether the required safety function is supported by the connected axis.
C005	The status byte could not be read.	Check whether the required safety function is supported by the connected axis.
C006	The control byte could not be written.	Check whether the required safety function is supported by the connected axis.

Table 536: SF_oS_MOTION_(Basic, Speed, Advanced, AbsPos)_BR: Diagnostic codes

5.8 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR to be applied to each axis being used in the safety application. Otherwise, the internal state machine of the axis remains in state IDLE, and pulse disabling and the holding brake output cannot be enabled.

Alternatively, function block SF_oS_MOTION_BR can be used; it represents the combination of all available function sets.

6.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function	
Activate	BOOL	Variable/ Constant	State	FALSE	Enables the function block (= TRUE) Input "Activate" according to the PLCopen standard	
S_Control_SDI-P	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Direction (SDI). Movement in the positive direction is allowed. SAFEFALSE: Safety function requested	
S_Control_SDI-N	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Direction (SDI). Movement in the negative direction is allowed. SAFEFALSE: Safety function requested	
S_Control_SLI	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Increment (SLI). SAFEFALSE: Safety function requested	
S_Control_SBT	SAFEBOOL	Variable/ Constant	Edge	SAFEFALSE	Request for safety function Safe Brake Test (SBT). The request is made on a falling edge!	
S_Control_SLT	SAFEBOOL	Variable/ Constant	Edge	SAFEFALSE	Request for safety function "Safely Limited Torque" (SLT) SAFEFALSE: Safety function requested	
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block	

Table 537: SF_oS_MOTION_Advanced_BR: Overview of input parameters

Evaluation of the input parameter signals in the function block. You must control the signals accordingly.

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_Advanced_BR

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled Output Ready according to the PLCopen standard
S_Status_SDI-P	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Direction" (SDI, positive direction) active (i.e. SAFETRUE)
S_Status_SDI-N	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Direction" (SDI, negative direction) active (i.e. SAFETRUE)
S_Status_SLI	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safely Limited Increment" (SLI) active, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SBT	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Brake Test" (SBT) completed successfully, status of test is valid (i.e. SAFETRUE)
S_Status_SBT-Active	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safe Brake Test" (SBT) active (i.e. SAFETRUE)
S_Status_SLT	SAFEBOOL	Variable	State	SAFEFALSE	Safety function "Safely Limited Torque" (SLT) active, no violation of a monitored limit (i.e. SAFETRUE)
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message

Table 538: SF_oS_MOTION_Advanced_BR: Overview of output parameters

1) Output of the output parameter signals. You must evaluate and/or further process the signals accordingly.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 539: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

6.2 SafeMOTION module parameters

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 540: SafeMOTION parameter group: Advanced functions - SDI

Group: Advanced functions - SLI (previously Safely Limited Increment)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLI - Position limit (previously Safe Increments (units))	[units]	Maximum movable increments when SLI is active	0	R 1.3
SLI - Disable delay time (previously <i>SLI Off Delay (μs)</i>)	[µs]	Switch off delay of SLI	0	R 1.3

Table 541: SafeMOTION parameter group: Advanced functions - SLI

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} \le EUS$ - Maximum speed to normalize speed range This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

openSAFE-Y_BuR_Motion_S

6.3 Integrated safety functions

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

6.4 Safe encoder connection

See 2.3.3 "Safe encoder connection" on page 304.

6.5 Fault avoidance

See 3.4 "Fault avoidance" on page 497.

6.6 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

6.6.1 General information about "S_Control" inputs

"S_Control" inputs are used to request the respective safety functions.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

To enable the function block itself and assign the functions to a defined axis, inputs "Activate" and "S AxisID" must be connected at a minimum.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR (or alternatively, function block SF_oS_MOTION_BR) to be applied to each axis being used in the safety application.

openSAFE-

6.6.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.

All binary output parameters are set to FALSE.

Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

6.6.3 S_Control_SDI-P

General function

· Selects/Deselects safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the positive direction of movement.

SAFETRUE

The safety function is deselected. SDI is not active!

SAFEFALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the positive direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 542: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 543: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

openSAFE-FY_BuR_Motion_SI

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

6.6.4 S_Control_SDI-N

General function

• Selects/Deselects safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the negative direction of movement.

SAFETRUE

The safety function is deselected. SDI is not active!

SAFEFALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the negative direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 544: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 545: SafeMOTION parameter group: Advanced functions - SDI

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

openSAFE-TY_BuR_Motion_S

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

6.6.5 S_Control_SLI

General function

· Selects/Deselects safety function Safely Limited Increment, SLI

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLI safety function.

SAFETRUE

The safety function is deselected. SLI is not active!

SAFEFALSE

The safety function is selected. A safe range of increments is monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				

Table 546: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SLI (previously Safely Limited Increment)

,,,,,					
Parameter	Unit	Description	Default value	Starting in Safety Release	
SLI - Position limit	[units]	Maximum movable increments when SLI is active	0	R 1.3	
(previously Safe Increments (units))					
SLI - Disable delay time	[µs]	Switch off delay of SLI	0	R 1.3	
(previously SLI Off Delay (µs))					

Table 547: SafeMOTION parameter group: Advanced functions - SLI

Danger!

The maximum increment range must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

6.6.6 S_Control_SBT

General function

· Selects/Deselects safety function Safe Brake Test, SBT

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to start the SBT safety function.

Negative edge

A negative edge (state transition from SAFETRUE to SAFEFALSE on input parameter "S_Control_SBT") starts safety function Safe Brake Test, SBT.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Advanced functions - SBT (previously Safe Brake Test) (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION (hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBT - Threshold (previously Safe Brake Test threshold (uA))	[µA]	Threshold value for the stator current that must be exceeded during the brake test	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - External load (previously Safe Brake Test external load (uA))	[µA]	External load	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Position tolerance (previously Safe Brake Test position tolerance (units))	[units]	Position tolerance	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Maximum torque duration (previously Safe Brake Test maximum torque duration (us))	[µs]	Duration of the test for which the maximum torque must be present	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Test interval (previously Safe Brake Test interval (s))	[s]	Retry interval for the safe brake test	28800	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Enable delay time (previously <i>Delay Time to start</i> SBT (us))	[µs]	Delay time between the SBT request and activation of the safety function	0	R 1.7 SinCos R 1.10 ACOPOS P3

Table 548: SafeMOTION parameter group: Advanced functions - SBT

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

openSAFE-Y_BuR_Motion_SF

6.6.7 S_Control_SLT

General function

· Selects/Deselects safety function Safely Limited Torque, SLT

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLT safety function.

SAFETRUE

The safety function is deselected. SLT is not active!

SAFEFALSE

The safety function is selected. The configured motor torque limit is monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Advanced functions - SLT (only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in
				Safety Re-
SLT - Torque limit	[mNm]	Torque limitation monitored during activation of SLT	0	R 1.10
SLT - Enable delay time	[µs]	Delay time between the SLT request and activation of the safety function	0	R 1.10

Table 549: SafeMOTION parameter group: Advanced functions - SLT

Group: General settings - Motor (only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Motor - Number of pole pairs (hardware upgrade 1.10.2.x and later)	-	Number of pole pairs on the rotor circumference	1	1.10
Motor - Direction*) (hardware upgrade 1.10.2.x and later)	Standard / Inverse	Direction of rotation of the motor	Standard	1.10
Motor - Stator resistance (hardware upgrade 1.10.2.x and later)	mOhm	Ohmic stator resistance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Stator inductance (hardware upgrade 1.10.2.x and later)	μH	Stator inductance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Torque constant (hardware upgrade 1.10.2.x and later)	μNm / A	Torque constant of the motor	0	1.10
Motor - Rated speed (hardware upgrade 1.10.2.x and later)	units/s	Nominal speed of the motor	0	1.10
Motor - Stall current (hardware upgrade 1.10.2.x and later)	mA	Stall current of the motor	0	1.10
Motor - Rated current (hardware upgrade 1.10.2.x and later)	mA	Nominal current of the motor	0	1.10
Motor - Peak current (hardware upgrade 1.10.2.x and later)	mA	Peak current of the motor	0	1.10

Table 550: SafeMOTION parameter group: General settings - Motor

SafeMOTION User's Manual V 4.6.1

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_Advanced_BR

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Motor - Stall torque (hardware upgrade 1.10.2.x and later)	mNm	Stall torque of the motor that is output when the stall current is applied	0	1.10
Motor - Peak torque (hardware upgrade 1.10.2.x and later)	mNm	Peak torque of the motor that is briefly output when the peak current is applied	0	1.10
Motor - Moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	Mass moment of inertia of the motor. Consists of the sum of the inertias of the rotor, encoder and holding brake.	0	1.10
Motor - External moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	External mass moment of inertia, depends on the total external load	0	1.10

Table 550: SafeMOTION parameter group: General settings - Motor

^{*)} The direction of rotation of the motor is not related to the counting direction of the speed ("EUS - Counting direction"), i.e. the direction of rotation of the motor can be changed explicitly in the non-safe application and must therefore also be taken into account in SafeDESIGNER.

openSAFE-TY_BuR_Motion_3

6.6.8 S_AxisID

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and function block SF_oS_MOTION_Advanced_BR or SF_oS_MOTION_BR in the safety application. Otherwise, it will not be possible to compile the safety application.

6.7 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

6.7.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

openSAFE-TY_BuR_Motion_3

6.7.2 S_Status_SDI-P

General function

· Status information for safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIpos safety function

SAFETRUE

The SDIpos safety function is active and currently in its safe state.

SAFEFALSE

The safety function is not requested or has not yet reached its safe state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

6.7.3 S_Status_SDI-N

General function

• Status information for safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIneg safety function

SAFETRUE

The SDIneg safety function is active and currently in its safe state.

SAFEFALSE

The safety function is not requested or has not yet reached its safe state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

openSAFE-Y_BuR_Motion_S

6.7.4 S_Status_SLI

General function

· Status information for safety function Safely Limited Increment

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLI safety function

SAFETRUE

The SLI safety function is active and currently in its safe state.

SAFEFALSE

The safety function is not requested or has not yet reached its safe state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

6.7.5 S_Status_SBT

General function

· Additional information for testing the holding brake with Safe Brake Test

Data type

SAFEBOOL

Connection

Variable

Function description

Returns the status of the holding brake test with Safe Brake Test, SBT

SAFETRUE

The SBT safety function has been executed. The status of the testing is valid.

SAFEFALSE

The SBT safety function has not been executed. The status of the testing is invalid or expired.

openSAFE-TY_BuR_Motion_3

6.7.6 S_Status_SBT-Active

General function

· Additional information for testing the holding brake with Safe Brake Test

Data type

SAFEBOOL

Connection

· Variable

Function description

Returns the status of the holding brake test with Safe Brake Test, SBT

SAFETRUE

Testing of the holding brake with SBT is being executed.

SAFEFALSE

Testing of the holding brake with SBT is not requested.

6.7.7 S_Status_SLT

General function

· Status information for safety function Safely Limited Torque

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLT safety function

SAFETRUE

The SLT safety function is active and currently in its safe state.

SAFEFALSE

Safety function SLT is not requested or has not yet reached its safe state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

openSAFE-Y_BuR_Motion_S

6.7.8 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on input "S_Control_Reset" must change from SAFE-FALSE to SAFETRUE (positive edge).

6.7.9 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

6.7.10 Overview of diagnostic codes

Diagnostic codes

Code (hex)	Description	Corrective measures
0000	The function block is not enabled. If "Activate" is connected to a variable that indicates the state of the connected safe device (active, inactive or peripheral fault detected), then the safe device is not active or has detected a fault in the connected peripheral.	 Enable the function block by setting "Activate" to SAFETRUE. Enable the safe device if "Activate" is connected to a variable that indicates the state of a connected safe device (active, inactive or peripheral fault detected), or correct the fault in the peripheral according to the device description.
8000	The function block detected neither a status nor an error to set the enable output to SAFEFALSE.	 If this is a desired signal combination at the signal inputs, no action is required. If the signal combination on the signal inputs is unintended,
C001	The function set for the control byte was not found.	check the connected peripheral and correct any faults. Check whether the required safety function is supported by the connected axis.
C002	The function set for the status byte was not found.	Check whether the required safety function is supported by the connected axis.
C003	The function set ID that was read does not match.	Check whether the required safety function is supported by the connected axis.
C004	The data length of the function set that was read is invalid.	Check whether the required safety function is supported by the connected axis.
C005	The status byte could not be read.	Check whether the required safety function is supported by the connected axis.
C006	The control byte could not be written.	Check whether the required safety function is supported by the connected axis.

Table 551: SF_oS_MOTION_(Basic, Speed, Advanced, AbsPos)_BR: Diagnostic codes

6.8 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

7 SF_oS_MOTION_AbsPos_BR

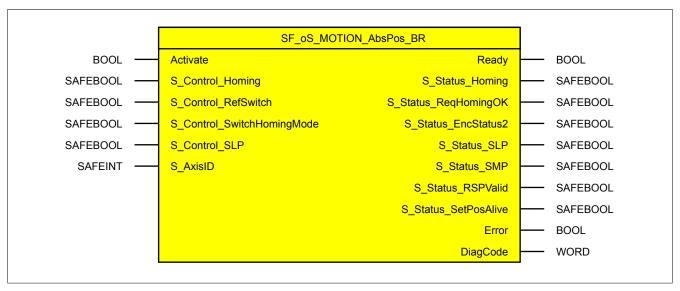

Figure 125: Function block SF_oS_MOTION_AbsPos_BR

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR to be applied to each axis being used in the safety application. Otherwise, the internal state machine of the axis remains in state IDLE, and pulse disabling and the holding brake output cannot be enabled.

Alternatively, function block SF_oS_MOTION_BR can be used; it represents the combination of all available function sets.

7.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/ Constant	State	FALSE	Enables the function block (= TRUE) Input "Activate" according to the PLCopen standard
S_Control_Homing	SAFEBOOL	Variable	Edge	SAFEFALSE	Request for safe homing. The request is made on a rising edge!
S_Control_RefSwitch	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Safe input for a reference switch
S_Control_SwitchHom- ingMode	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Enables homing with remanent safe position (RSP). SAFEFALSE: Homing with RSP disabled.
S_Control_SLP	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Position (SLP). SAFEFALSE: Safety function requested
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 552: SF oS MOTION AbsPos BR: Overview of input parameters

1) Evaluation of the input parameter signals in the function block. You must control the signals accordingly.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function	
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled Output "Ready" according to the PLCopen standard	
S_Status_Homing	SAFEBOOL	Variable	State	SAFEFALSE	Specifies whether the safe position is valid (i.e. SAFETRUE, homing procedure has completed successfully and there are no encoder errors)	
S_Status_ReqHomin- gOk	SAFEBOOL	Variable	State	SAFEFALSE	Feedback for homing in SafeDESIGNER (i.e. SAFETRUE, safe position is valid and request for safe homing is SAFETRUE)	
S_Status_EncStatus2	SAFEBOOL	Variable	State	SAFEFALSE	No encoder error has been detected (i.e. SAFETRUE), signal "S_ScaledSpeed_2Byte" is valid.	
S_Status_SLP	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Position (SLP) active (i.e. SAFETRUE)	
S_Status_SMP	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Maximum Position (SMP) active (i.e. SAFETRUE)	
S_Status_RSPValid	SAFEBOOL	Variable	State	SAFEFALSE	Validates and stores the remanent safe position (RSP) (TRUE = safe position is stored, power off for homing with RSP is now possible)	
S_Status_SetPosAlive	SAFEBOOL	Variable	State	SAFEFALSE	Status information about plausibility check of the position setpoint	
Error	BOOL	Variable	State	FALSE	Function block error message	
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message	

Table 553: SF_oS_MOTION_AbsPos_BR: Overview of output parameters

1) Output of the output parameter signals. You must evaluate and/or further process the signals accordingly.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 554: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

7.2 SafeMOTION module parameters

Group: Absolute position functions - Homing (previously *Homing*)

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Home position or home offset	[units]	Home position or home offset	0	R 1.4
(previously Home Position or Home Offset (units))				
Homing - Maximum trigger speed	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
(previously Max. trigger speed (units/s))				
Homing - Monitoring time	[µs]	Monitoring time for the homing procedure	0	R 1.4
(previously Homing Monitoring Time (μs))				
Homing - Mode	Direct / Reference	Selects the homing mode	Direct	R 1.4
(previously <i>Mode</i>)	switch / Home Offset / Home offset with correction	Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2!		
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system.	0	R 1.4
(% encoder reference system))		A single revolution is used as the encoder reference system for rotary encoders.		
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!		

Table 555: SafeMOTION parameter group: Absolute position functions - Homing

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release
SMP - Enable	Enabled/	Activates the SN	MP safety function from the configuration	Disabled	R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit (previously Safe Lower Position Limit for SMP (units))	[units]	Lower position li	imit for the machine's full travel range	0	R 1.4
SMP - Upper position limit (previously Safe Upper Position Limit for SMP (units))	[units]	Upper position li	imit for the machine's full travel range	0	R 1.4
SLP - Lower position limit (previously Safe Lower Position Limit for SLP (units))	[units]	Lower position li	imit for the monitoring range	0	R 1.4
SLP - Upper position limit (previously Safe Upper Position Limit for SLP (units))	[units]	Upper position li	imit for the monitoring range	0	R 1.4
SLP - Enable delay time (previously <i>Delay time to start</i> <i>SLP</i> (us))	[µs]	Delay time betw	een the SLP request and start of monitoring	0	R 1.4

Table 556: SafeMOTION parameter group: Absolute position functions - SMP/SLP

Group: General settings - Behavior of Functional Fail Safe (FFS) (previously Behavior of Functional Fail Safe)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
FFS - Mode	STO / STO1 and STO		AL FAIL SAFE state, STO and SBC are activated immes activated and then STO after a delay.	STO	R 1.3

SafeMOTION and hardware	are enabled	and an encoder er			
upgrade 1.10.2.x or later for ACOPOS P3 SafeMOTION)			tions requiring an encoder are enabled: ast one safety function that requires an encoder is active rror is present.		

Table 557: SafeMOTION parameter group: General settings - Behavior of Functional Fail Safe (FFS)

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} ≤ EUS - Maximum speed to normalize speed range This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

7.3 Integrated safety functions

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

7.4 Safe encoder connection

See 2.3.3 "Safe encoder connection" on page 304.

7.5 Fault avoidance

See 3.4 "Fault avoidance" on page 497.

openSAFE-TY_BuR_Motion_3

7.6 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

7.6.1 General information about "S_Control" inputs

"S_Control" inputs are used to request the respective safety functions.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

To enable the function block itself and assign the functions to a defined axis, inputs "Activate" and "S AxisID" must be connected at a minimum.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR (or alternatively, function block SF_oS_MOTION_BR) to be applied to each axis being used in the safety application.

In addition to inputs "Activate" and "S_AxisID", inputs "S_Control_Reset" and "S_Control_Activate" must also be used. Otherwise, the SafeDESIGNER project cannot be compiled.

7.6.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.

All binary output parameters are set to FALSE.

Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

7.6.3 S_Control_Homing

General function

· Selects/Deselects safety function "Safe Homing"

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to start a "Safe Homing" procedure. A positive edge of the input starts the safety function.

Positive edge: Change from SAFEFALSE to SAFETRUE

Starts "Safe Homing".

Negative edge: Change from SAFETRUE to SAFEFALSE

If still active, the homing procedure will be terminated by the negative edge. This state transition has no effect if the homing procedure has already been completed.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Absolute position functions - Homing (previously Homing)

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Mode (previously <i>Mode</i>)	Direct / Reference switch / Home Offset / Home offset with correction	Selects the homing mode Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		R 1.4
Homing - Home position or home offset (previously Home Position or Home Offset (units))	[units]	Home position or home offset	0	R 1.4
Homing - Enable RSP (Rema- nent safe position) (previously Remanent safe po- sition)	Enabled/ Disabled	Selects whether or not to use the remanent safe position This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.9
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4

Table 558: SafeMOTION parameter group: Absolute position functions - Homing

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_AbsPos_BR

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference system))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders. This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		R 1.4
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
Homing - Monitoring time (previously <i>Homing Monitoring Time</i> (μs))	[µs]	Monitoring time for the homing procedure	0	R 1.4

Table 558: SafeMOTION parameter group: Absolute position functions - Homing

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The Safe Homing function is needed in order to implement the safety functions SLP and SMP and for using the safe position.

The "SafePositionValid" status bit will remain set to SAFEFALSE until safe homing has been performed!

openSAFE-TY_BuR_Motior

7.6.4 S Control RefSwitch

General function

· Reference switch input for safety function "Safe Homing"

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter serves as a reference switch input for the "Safe Homing" safety function and is only evaluated in the "Reference Switch" homing mode.

The status of a safe reference switch that was read into the safety application via a safe input module (X20SIxxxx), for example, should be linked to the input.

Not connected

The reference switch is not being used!

Information:

If "Reference Switch" homing mode is configured and the reference switch input "S_ReferenceSwitch" is not wired on the function block, then the SafeMOTION module will switch to the FAIL SAFE state. The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Information:

Input "S_Control_RefSwitch" is only evaluated in homing mode "Reference Switch". The input is ignored in other homing modes!

7.6.5 S_Control_SwitchHomingMode

General function

• This input is used by safety function "Remanent Safe Position" and enables a homing procedure that confirms the remanent safe position.

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to switch between homing with RSP and the configured homing mode.

SAFETRUE

When a homing command is given (i.e. positive edge on input "S_Control_RequestHoming"), then homing mode "Homing with RSP" is used.

SAFEFALSE

When a homing command is given (i.e. positive edge on input "S_Control_RequestHoming"), then the configured homing mode is used.

Relevant configuration parameters

Parameter	Unit	Description	Default value
Homing			
Remanent Safe Position	Enabled/ Disabled	Selects whether or not to use the remanent safe position	Disabled
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!	
Safety Standstill and Direction	Tolerances		
Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring	0
Position Tolerance	[units]	Position tolerance for standstill and direction monitoring	0

Table 559: RSP safety function - Parameters

7.6.6 S_Control_SLP

General function

· Selects/Deselects safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLP safety function.

SAFETRUE

The safety function is deselected. SLP is not active!

SAFEFALSE

The configured position window will be safety-monitored after "Delay time to start SLP (us)".

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 560: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLP - Lower position limit	[units]	Lower position limit for the monitoring range	0	R 1.4
(previously Safe Lower Position Limit for SLP (units))				
SLP - Upper position limit	[units]	Upper position limit for the monitoring range	0	R 1.4
(previously Safe Upper Position Limit for SLP (units))				
SLP - Enable delay time	[µs]	Delay time between the SLP request and start of monitoring	0	R 1.4
(previously <i>Delay time to start SLP</i> (<i>us</i>))				

Table 561: SafeMOTION parameter group: Absolute position functions - SMP/SLP

SafeMOTION User's Manual V 4.6.1

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance</i> (units))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 562: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

Information:

Safe homing of the axis must be completed prior to using this safety function.

If a homing procedure is not completed successfully or the "S_SafePositionValid" status changes, then the request for the SLP safety function causes the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. The output of function block "S_NotErrFUNC" is reset.

openSAFE-TY_BuR_Motion_3

7.6.7 **S_AxisID**

General function

· This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and function block SF_oS_MOTION_Advanced_BR or SF_oS_MOTION_BR in the safety application. Otherwise, it will not be possible to compile the safety application.

7.7 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

7.7.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

openSAFE-TY_BuR_Motior

7.7.2 S_Status_Homing

General function

· Status information for safety function "Safe Homing" and the safe position

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether or not safe homing of the axis has been completed and whether or not the position signal is valid.

SAFETRUE

The axis has been safely homed, and the safe position is valid.

SAFEFALSE

The axis has not yet been successfully homed; the encoder signal of the axis is faulty. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled. The safe position is invalid!

Danger!

The purpose of this signal is only to provide additional information.

"S_Status_Homing" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of output parameter "S_SafePosition_4Byte" is only valid if output parameter S_SafePositionValid is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

7.7.3 S_Status_ReqHomingOK

General function

· Feedback for homing in SafeDESIGNER

Data type

SAFEBOOL

Connection

Variable

Function description

This status is set to provide feedback in the event that homing is requested when already in a homed state ("S_Control_Homing" and "S_Status_Homing" are set).

SAFETRUE

The input for homing is set ("S_Control_Homing" = SAFETRUE), and the safe position is valid ("S_Status_Homing" = SAFETRUE).

SAFEFALSE

The input for homing is not set or the safe position is not valid. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

openSAFE-"Y_BuR_Motion_S

7.7.4 S_Status_EncStatus2

General function

· Information about the error state of the safe encoder signal

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the error state of the signal for a defined safe encoder.

If an encoder error is detected or the SafeMOTION module is in an error state, then the output is set to FALSE. This state is maintained until the error has been corrected.

SAFETRUE

An error was not detected on the encoder signal.

SAFEFALSE

The encoder signal from a defined safe axis is faulty, or the axis itself is in an error state. For more information about the error, see the Safety Logger in Automation Studio.

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_Status_EncStatus2" does not represent the functional safe state of the SafeMOTION module!

7.7.5 S_Status_SLP

General function

· Status information for safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLP safety function

SAFETRUE

The SLP safety function is active and currently in its safe state.

SAFFFALSE

The safety function is not requested or has not yet reached its safe state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

openSAFE-TY_BuR_Motion_3

7.7.6 S_Status_SMP

General function

· Status information for safety function Safe Maximum Position, SMP

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SMP safety function

SAFETRUE

The SMP safety function is active and currently in its safe state.

SAFEFALSE

Monitoring of the SMP position limits is not active. Monitoring is not yet active since the SafeMOTION module has not yet been homed. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

7.7.7 S_Status_RSPValid

General function

· Status information for the "Remanent safe position" safety function

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the following:

- The current safe position has been homed, validated and saved.
- Changes to the safe position are prevented by the active STO and SOS safety functions.
- Powering off the module does not result in loss of the safe remanent position.

SAFETRUE

The safe position has been saved successfully. Power off for homing with RSP is possible in this state.

SAFEFALSE

One or more of the following is true:

- The axis was not successfully homed. (The state of "S_Status_Homing" is not TRUE.)
- The STO safety function is not selected/active.
- The SOS safety function is not selected/active.
- The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

openSAFE-

7.7.8 S_Status_SetPosAlive

General function

· Status information about plausibility check of the position setpoint

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether the plausibility of the position setpoint has been checked.

SAFETRUE

The plausibility of the position setpoint was checked successfully.

SAFEFALSE

The plausibility of the position setpoint was faulty or not checked. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

7.7.9 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on input "S_Control_Reset" must change from SAFE-FALSE to SAFETRUE (positive edge).

openSAFE-Y_BuR_Motion_S

7.7.10 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

7.7.11 Overview of diagnostic codes

Diagnostic codes

Code (hex)	Description	Corrective measures
0000	The function block is not enabled.	Enable the function block by setting "Activate" to SAFETRUE.
	If "Activate" is connected to a variable that indicates the state of the connected safe device (active, inactive or peripheral fault detected), then the safe device is not active or has detected a fault in the connected peripheral.	indicates the state of a connected safe device (active, inactive
8000	The function block detected neither a status nor an error to set the enable output to SAFEFALSE.	 If this is a desired signal combination at the signal inputs, no action is required.
		 If the signal combination on the signal inputs is unintended, check the connected peripheral and correct any faults.
C001	The function set for the control byte was not found.	Check whether the required safety function is supported by the connected axis.
C002	The function set for the status byte was not found.	Check whether the required safety function is supported by the connected axis.
C003	The function set ID that was read does not match.	Check whether the required safety function is supported by the connected axis.
C004	The data length of the function set that was read is invalid.	Check whether the required safety function is supported by the connected axis.
C005	The status byte could not be read.	Check whether the required safety function is supported by the connected axis.
C006	The control byte could not be written.	Check whether the required safety function is supported by the connected axis.

Table 563: SF_oS_MOTION_(Basic, Speed, Advanced, AbsPos)_BR: Diagnostic codes

7.8 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

Figure 126: Function block "SF_oS_MOTION_BR"

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

Information:

This function block provides access to all available function sets.

If this function block is used in SafeDESIGNER, then the same "S_AxisID" is not permitted to be simultaneously used with function block SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR or SF_oS_MOTION_AbsPos_BR!

8.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/	State	FALSE	Enables the function block (= TRUE)
S AxisID	SAFEINT	Constant	State	-1	Input "Activate" according to the PLCopen standard Assigns an axis to the function block
S Control Reset	SAFEBOOL	Variable/	Edge	SAFEFALSE	Resets error messages and the SafeMOTION mod-
0_00111101_110001	O/ II 25002	Constant	Lago	07 11 21 7 1202	ule after the cause of the error has been removed
S_Control_Activate	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	SAFETRUE: Starts the state machine of the safe axis, safety functions can be enabled. SAFEFALSE: Sets the state machine of the safe axis to state IDLE
S_Control_STO	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Torque Off (STO). SAFEFALSE: Safety function requested
S_Control_SBC	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Brake Control (SBC). SAFEFALSE: Safety function requested
S_Control_SS1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Stop 1 (SS1). SAFEFALSE: Safety function requested
S_Control_STO1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Torque Off, One Channel (STO1). SAFEFALSE: Safety function requested
S_Control_SOS	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Operating Stop (SOS). SAFEFALSE: Safety function requested
S_Control_SS2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Stop 2 (SS2). SAFEFALSE: Safety function requested
S_Control_SLA	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Acceleration (SLA). SAFEFALSE: Safety function requested
S_Control_SLS-1	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 1 (SLS-1). SAFEFALSE: Safety function requested
S_Control_SLS-2	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 2 (SLS-2). SAFEFALSE: Safety function requested
S_Control_SLS-3	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 3 (SLS-3). SAFEFALSE: Safety function requested
S_Control_SLS-4	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Speed, Speed Limit 4 (SLS-4). SAFEFALSE: Safety function requested
S_Control_SDI-P	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Direction (SDI). Movement in the positive direction is allowed. SAFEFALSE: Safety function requested
S_Control_SDI-N	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safe Direction (SDI). Movement in the negative direction is allowed. SAFEFALSE: Safety function requested
S_Control_SLI	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Increment (SLI). SAFEFALSE: Safety function requested
S_Control_SBT	SAFEBOOL	Variable/ Constant	Edge	SAFEFALSE	Request for safety function Safe Brake Test (SBT). The request is made on a falling edge!
S_Control_SLT	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Torque (SLT) SAFEFALSE: Safety function requested
S_Control_Homing	SAFEBOOL	Variable	Edge	SAFEFALSE	Request for safe homing. The request is made on a rising edge!
S_Control_RefSwitch	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Safe input for a reference switch
S_Control_SwitchHomingMode	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Enables homing with remanent safe position (RSP). SAFEFALSE: Homing with RSP disabled.
S_Control_SLP	SAFEBOOL	Variable/ Constant	State	SAFEFALSE	Request for safety function Safely Limited Position (SLP). SAFEFALSE: Safety function requested

Table 564: "SF_oS_MOTION_BR": Overview of input parameters

¹⁾ Evaluation of the input parameter signals in the function block. You must control the signals accordingly.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled Output "Ready" according to the PLCopen standard
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message
S_Status_NotErrFunc	SAFEBOOL	Variable	State	SAFEFALSE	SafeMOTION module not in state FUNCTIONAL FAIL SAFE (i.e. SAFETRUE)
S_Status_Operational	SAFEBOOL	Variable	State	SAFEFALSE	Status of the state machine of the safe axis SAFEFALSE: State machine not in state OPERATION- AL
S_Status_STO	SAFEBOOL	Variable	State	SAFEFALSE	SAFETRUE: State machine in state OPERATIONAL Safety function Safe Torque Off (STO) is active (i.e. SAFETRUE).
S_Status_SBC	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Brake Control (SBC) is active (i.e. SAFETRUE).
S_Status_SS1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Stop 1 (SS1) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_STO1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Torque Off, One Channel (STO1) is active (i.e. SAFETRUE).
S_Status_SDC	SAFEBOOL	Variable	State	SAFEFALSE	Deceleration monitoring is active (i.e. SAFETRUE).
S_Status_EncStatus	SAFEBOOL	Variable	State	SAFEFALSE	No encoder error has been detected (i.e. SAFETRUE), signal "S_ScaledSpeed" is valid.
S_Status_SOS	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Operating Stop (SOS) active, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SS2	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Stop 2 (SS2) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLA	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Acceleration (SLA) active, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-1	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Speed, Speed Limit 1 (SLS-1) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-2	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Speed, Speed Limit 2 (SLS-2) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-3	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Speed, Speed Limit 3 (SLS-3) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SLS-4	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Speed, Speed Limit 4 (SLS-4) is active, deceleration monitoring is completed, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SDI-P	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Direction (SDI, positive direction) active (i.e. SAFETRUE)
S_Status_SDI-N	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Direction (SDI, negative direction) active (i.e. SAFETRUE)
S_Status_SLI	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Increment (SLI) active, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_SBT	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Brake Test (SBT) completed successfully, status of test is valid (i.e. SAFETRUE)
S_Status_SBT-Active	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Brake Test (SBT) active (i.e. SAFETRUE)
S_Status_SLT	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Torque (SLT) active, no violation of a monitored limit (i.e. SAFETRUE)
S_Status_Homing	SAFEBOOL	Variable	State	SAFEFALSE	Specifies whether the safe position is valid (i.e. SAFETRUE, homing procedure has completed successfully and there are no encoder errors)
S_Status_ReqHomingOl	SAFEBOOL	Variable	State	SAFEFALSE	Feedback for homing in SafeDESIGNER (i.e. SAFETRUE, safe position is valid and request for safe homing is SAFETRUE)
S_Status_EncStatus2	SAFEBOOL	Variable	State	SAFEFALSE	No encoder error has been detected (i.e. SAFETRUE), signal "S_ScaledSpeed" is valid.
S_Status_SLP	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safely Limited Position (SLP) active (i.e. SAFETRUE)
S_Status_SMP	SAFEBOOL	Variable	State	SAFEFALSE	Safety function Safe Maximum Position (SMP) active (i.e. SAFETRUE)
S_Status_RSPValid	SAFEBOOL	Variable	State	SAFEFALSE	Validates and stores the remanent safe position (RSP) (TRUE = safe position is stored, power off for homing with RSP is now possible)
S_Status_SetPosAlive	SAFEBOOL	Variable	State	SAFEFALSE	Status information about plausibility check of the position setpoint

Table 565: "SF_oS_MOTION_BR": Overview of output parameters

¹⁾ Output of the output parameter signals. You must evaluate and/or further process the signals accordingly.

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_BR

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 566: Format description of the data types

You have the option of linking a safe signal with a non-safe input parameter. To do so, use a function block for type conversion.

Caution!

You are responsible for any conversion of a non-safe input parameter to a safe signal.

8.2 SafeMOTION module parameters

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit			Default value	Used Starting in Safety Release
Automatic reset on start - En-	Enabled/	Activates automatic reset of the function block at startup		Disabled	R1.3
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 567: SafeMOTION parameter group: General settings - Automatic reset on start

Group: General settings - Behavior of Functional Fail Safe (FFS) (previously *Behavior of Functional Fail Safe*)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
FFS - Mode	STO / STO1 and STO		AL FAIL SAFE state, STO and SBC are activated immess activated and then STO after a delay.	STO	R 1.3
(previously Behavior of Func-	with time delay	Value	Description		
tional Fail Safe)		STO	In the FUNCTIONAL FAIL SAFE state, STO and SBC are activated immediately.		
		STO1 and STO with time delay	In the FUNCTIONAL FAIL SAFE state, STO1 and SBC are activated first, and then STO after a delay.		
FFS - STO Enable delay time	[µs]	Delay time between STO1 and STO (and SBC) in the FUNCTIONAL FAIL SAFE state		0	R 1.3
(previously Delay for STO in Functional Fail Safe [µs])					
FFS - Delay time until brake engages (previously <i>Delay time until the</i>	[µs]	Delay time before the brake engages The second enable channel is activated after this delay time if STO1 and time-delayed STO and SBC are configured for FUNCTIONAL FAIL SAFE.		0	R 1.3
brake engages [µs])					
FFS - Caused by encoder error (1.10.1.x for ACOPOSmulti	Always / Only if safety functions re- quiring an encoder	Enable FUNCTIONAL FAIL SAFE on encoder error: Always: FFS occurs if at least one safety function that requires an encoder is used		Always	R 1.10.1
SafeMOTION and hardware upgrade 1.10.2.x or later for ACOPOS P3 SafeMOTION)	are enabled	and an encoder en Only if safety func	rror is present. tions requiring an encoder are enabled: ast one safety function that requires an encoder is active		

Table 568: SafeMOTION parameter group: General settings - Behavior of Functional Fail Safe (FFS)

Group: General settings - Encoder Unit System (previously Encoder Unit System)

Parameter	Unit	Description		Default value	Starting in Safety Release
EUS - Count of physical reference system (previously Count of physical reference system)	-	Rotary encoder un Linear encoder uni the physical refere Any unit (mm, 1/10 positions (and data For this reason, the per x revolutions / x refe		R 1.4	
EUS - Units per count of physical reference system (previously <i>Units per count of physical reference system [units]</i>)	[units]	Rotary encoder un Linear encoder uni Any unit (mm, 1/10 positions (and data For this reason, the per x revolutions / x refe		R 1.4	
EUS - Counting direction	Standard /		of the position or speed	Default	R 1.3
(previously Counting direction)	Inverse	Default Inverse	Encoder counting direction is equal to the counting direction of the unit system. Encoder counting direction is negative to the counting direction of the unit system.		
EUS - Length of physical ref- erence system for linear en- coder (previously Length of physical reference system for linear en- coder (nm))	[nm]	For linear measurement systems, the length of a physical reference system is defined here. This value is not used for rotary encoders, where the reference system is a single revolution.		1000000000	R 1.4
EUS - Maximum speed to nor- malize speed range (previously <i>Maximum speed</i> to normalize the speed range (units/s))	[units/s]	Maximum speed to which the displayed speed should be normalized		32767	R 1.3
EUS - Encoder acceleration limit (previously Maximum acceler- ation (rad/s² or mm/s²))	[rad/s²] or [mm/s²]	Maximum permissi	ible encoder acceleration	100000	R 1.4

Table 569: SafeMOTION parameter group: General settings - Encoder Unit System

openSAFE-TY BuR Motion SF

Group: General settings - Encoder monitoring (previously *Encoder Monitoring*)

Parameter	Unit	Description		Default value	Starting in Safety Release
Encoder monitoring - Safe En-	From motor data	Status of the proof	of fatigue strength of the encoder mounting	From motor data	R1.10
coder Mounting (Hardware up-	record / Approved	Value	Description	record	
grade 1.10.3.x and later)	by user	From motor data record	The status of the encoder mounting is determined using the motor data record.		
		Approved by user	The user confirms safe encoder mounting / no mounting information available in the motor data record.		
Encoder monitoring - Position error monitoring - Enable	Enabled/ Disabled	Enables/Disables SafeMOTION mod	monitoring of the position lag error generated on the tule	Enabled	R1.3
		Value	Description		
(previously Encoder Position		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Speed error monitoring - Enable			Activates/Deactivates monitoring of the speed error generated on the SafeMOTION module		R1.3
		Value	Description		
(previously Encoder Speed		Enabled	Monitoring active		
monitoring)		Disabled	Monitoring not active		
Encoder monitoring - Position setpoint alive testing (SPA) -	Enabled/ Disabled	Activates/Deactivates the monitor that detects whether the position setpoint generated on the SafeMOTION module is frozen.		Disabled	R1.3
Enable		Value	Description		
		Enabled	Monitoring active		
(previously Set position alive testing)		Disabled	Monitoring not active		
Encoder monitoring - Position error tolerance (previously Encoder monitor-	[units]	Position lag error t	olerance for shaft breakage monitoring	0	R1.3
ing Position tolerance (units))					
Encoder monitoring - Speed error tolerance	[units/s]	Speed error tolera	nce for encoder monitoring	0	R1.3
(previously Encoder monitor- ing Speed tolerance (units/s))					

Table 570: SafeMOTION parameter group: General settings - Encoder monitoring

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance (previously Speed Tolerance (units/s))	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
Standstill monitoring - Position tolerance (previously <i>Position Tolerance</i> (units))	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3

Table 571: SafeMOTION parameter group: General settings - Standstill monitoring

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	below the lower lin "Early limit monitor falls below the end	eceleration ramp monitoring is terminated prematurely if the value falls elow the lower limit carly limit monitoring": If the current speed during the deceleration process ils below the end speed limit of the activated safety function for a defined mount of time, then the safe state of the respective function will be activated prematurely.		R 1.3
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[µs]	Time during which the speed must be below the target speed limit in order to prematurely end the deceleration ramp and to assume the safety function's end state		0	R 1.3

Table 572: SafeMOTION parameter group: General settings - Early limit monitoring

SafeMOTION User's Manual V 4.6.1

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
Ramp monitoring - Enable de- lay time (previously <i>Delay time to start</i> ramp monitoring (us))	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 573: SafeMOTION parameter group: General settings - Ramp monitoring

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	High-side/	Selects the high-side or low-side IGBT in the STO1 function		High-side	R 1.3
	Low-side	Value	Description		
(previously Channel selection for One Channel STO (STO1))	Hig	High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 574: SafeMOTION parameter group: Basic functions - STO1

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descript	ion	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled	addition	ramp-based monitoring (in to time-based monitoring) SS1 function is requested	Enabled	R 1.3
		Value	Description		
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously Ramp Monitoring Time for SS1 (us))	[µs]	Decelera SS1	tion ramp monitoring time for	0	R 1.3

Table 575: SafeMOTION parameter group: Basic functions - SS1

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 576: SafeMOTION parameter group: Basic functions - SBC

Group: Speed functions - SS2 (previously General Settings)

Parameter	Unit	Description	Description		Starting in Safety Release
SS2 - Ramp monitoring - Enable	Enabled/ Disabled		Activates ramp monitoring (in addition to time-based monitoring) when the SS2 function is requested		R 1.3
		Value	Description		
(previously Rampmonitoring for SS2)	Enabled Disabled	Enabled	When changing to the safe state of the SS2 function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SS2 function, only a configurable time is monitored		
Ramp Monitoring Time for SS2 (us)	[µs]	Deceleration ramp monitoring time for SS2		0	R 1.3

Table 577: SafeMOTION parameter group: Speed functions - SS2

Group: Speed functions - SLA (previously Safely Limited Acceleration)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLA - Acceleration limit in pos- itive direction (previously Safe acceleration	[units/s²]	Limit value for acceleration in the positive direction of movement	0	R 1.9
limit for SLA (units/s²) in positive direction)				
SLA - Deceleration limit in positive direction	[units/s ²]	Limit value for deceleration in the positive direction of movement	0	R 1.9
(previously Safe deceleration limit for SLA (units/s²) in positive direction)				
SLA - Acceleration limit in negative direction	[units/s ²]	Limit value for acceleration in the negative direction of movement	0	R 1.9
(previously Safe acceleration limit for SLA (units/s²) in negative direction)				
SLA - Deceleration limit in negative direction	[units/s ²]	Limit value for deceleration in the negative direction of movement	0	R 1.9
(previously Safe deceleration limit for SLA (units/s²) in negative direction)				
SLA - Enable delay time	[µs]	Delay time between the SLA request and activation of the safety function	0	R 1.9
(previously <i>Delay time to start SLA (us)</i>)				

Table 578: SafeMOTION parameter group: Speed functions - SLA

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description	Description		Starting in Safety Release
SMS - Enable	Enabled/	Activates the S	SMS safety function by configuration	Enabled	R 1.3
	Disabled	Value	Description		
(previously Safe Maximum		Enabled	SMS activated		
Speed)		Disabled	SMS deactivated		
SMS - Speed limit	[units/s]	Speed limit of	the maximum speed (SMS)	0	R 1.3
(previously Maximum Speed for SMS (units/s))					
SLS1 - Speed limit	[units/s]	Speed limit 1 f	Speed limit 1 for SLS (SLS1)		R 1.3
(previously Safe Speedlimit 1 for SLS (units/s))					
SLS2 - Speed limit	[units/s]	Speed limit 2 f	or SLS (SLS2)	0	R 1.3
(previously Safe Speedlimit 2 for SLS (units/s))					
SLS3 - Speed limit	[units/s]	Speed limit 3 f	or SLS (SLS3)	0	R 1.3
(previously Safe Speedlimit 3 for SLS (units/s))					
SLS4 - Speed limit	[units/s]	Speed limit 4 f	or SLS (SLS4)	0	R 1.3
(previously Safe Speedlimit 4 for SLS (units/s))					

Table 579: SafeMOTION parameter group: Speed functions - SMS/SLS

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_BR

Parameter	Unit	Description		Default value	Starting in Safety Release
SLS - Ramp monitoring - Enable	Enabled/ Disabled		b-based monitoring (in addition to time-based monitoring) when on is requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)		Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS1 - Ramp monitoring - Time	[µs]	Deceleration ra	Deceleration ramp monitoring time for SLS1		R 1.3
(previously Ramp Monitoring Time for SLS1 (us))					
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ramp monitoring time for SLS2		0	R 1.3
(previously Ramp Monitoring Time for SLS2 (us))					
SLS2 - Ramp monitoring - Time	[µs]	Deceleration ra	Deceleration ramp monitoring time for SLS3		R 1.3

SLS4 - Ramp monitoring - Time	[µs]	Deceleration ra	amp monitoring time for SLS4	0	R 1.3
(previously Ramp Monitoring Time for SLS4 (us))					

Table 579: SafeMOTION parameter group: Speed functions - SMS/SLS

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)				

Table 580: SafeMOTION parameter group: Advanced functions - SDI

Group: Advanced functions - SLI (previously Safely Limited Increment)

Croup! Advantage landing Carely Limited more money							
Parameter	Unit	Description	Default value	Starting in Safety Release			
SLI - Position limit (previously Safe Increments	[units]	Maximum movable increments when SLI is active	0	R 1.3			
(units))							
SLI - Disable delay time	[µs]	Switch off delay of SLI	0	R 1.3			
(previously SLI Off Delay (μs))							

Table 581: SafeMOTION parameter group: Advanced functions - SLI

Group: Absolute position functions - Homing (previously Homing)

Parameter Unit		Description		Starting in Safety Release	
Homing - Home position or home offset	[units]	Home position or home offset	0	R 1.4	
(previously Home Position or Home Offset (units))					
Homing - Maximum trigger speed	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4	
(previously Max. trigger speed (units/s))					
Homing - Monitoring time	[µs]	Monitoring time for the homing procedure	0	R 1.4	
(previously <i>Homing Monitoring Time</i> (µs))					

Table 582: SafeMOTION parameter group: Absolute position functions - Homing

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Mode	Direct / Reference	Selects the homing mode	Direct	R 1.4
(previously <i>Mode</i>)	switch / Home Offset / Home offset with correction	Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2!		
Homing - Edge of reference switch (previously <i>Edge of reference</i>	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
switch)		the positive direction of movement.		
Homing - Trigger direction (previously <i>Trigger direction</i>)	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter specifies the direction for evaluating the reference switch / reference pulse.	Positive	R 1.4
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference system))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders.	0	R 1.4
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!		

Table 582: SafeMOTION parameter group: Absolute position functions - Homing

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Description		Starting in Safety Release
SMP - Enable	Enabled/	Activates the SI	MP safety function from the configuration	Disabled	R 1.4
	Disabled	Value	Description		
(previously Safe Maximum Po-		Enabled	SMP is activated		
sition)		Disabled	SMP is deactivated		
SMP - Lower position limit	[units]	Lower position	limit for the machine's full travel range	0	R 1.4
(previously Safe Lower Position Limit for SMP (units))					
SMP - Upper position limit	[units]	Upper position	limit for the machine's full travel range	0	R 1.4
(previously Safe Upper Posi-					
tion Limit for SMP (units))	F - 21 - 2	1	P9 6 - 0 9 - 2	0	D 4 4
SLP - Lower position limit (previously Safe Lower Position Limit for SLP (units))	[units]	Lower position	limit for the monitoring range	0	R 1.4
SLP - Upper position limit	[units]	Upper position	limit for the monitoring range	0	R 1.4
(previously Safe Upper Position Limit for SLP (units))					
SLP - Enable delay time	[µs]	Delay time betw	veen the SLP request and start of monitoring	0	R 1.4
(previously Delay time to start SLP (us))					

Table 583: SafeMOTION parameter group: Absolute position functions - SMP/SLP

In a safety application, it is possible for multiple safety functions to be requested at the same time. In order to prevent this from turning into an unsafe situation, the individual safety functions are prioritized on the SafeMOTION module.

If several functions are active, then the lowest speed limit is always the value being monitored.

Information:

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS3} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} \le EUS$ - Maximum speed to normalize speed range

This is required for setting priority of the safety functions on the SafeMOTION module.

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

8.5 Fault avoidance

See 3.4 "Fault avoidance" on page 497.

openSAFE-

8.6 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

8.6.1 General information about "S_Control" inputs

"S_Control" inputs are used to request the respective safety functions.

Information:

If a safety function is not used in the application, then the respective input must remain open.

Danger!

The safety functions that are used must be tested.

A function is considered to be used if the respective input variable is connected!

Information:

To enable the function block itself and assign the functions to a defined axis, inputs "Activate" and "S AxisID" must be connected at a minimum.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR (or alternatively, function block SF_oS_MOTION_BR) to be applied to each axis being used in the safety application.

In addition to inputs "Activate" and "S_AxisID", inputs "S_Control_Reset" and "S_Control_Activate" must also be used. Otherwise, the SafeDESIGNER project cannot be compiled.

8.6.2 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.
All binary output parameters are set to FALSE.
Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

General function

 Input "S_Control_Reset" for acknowledging state FUNCTIONAL FAIL SAFE or for putting the SafeMOTION module into state OPERATIONAL after STARTUP

Data type

SAFEBOOL

Connection

Variable

Function description

Input "S_Control_Reset" for acknowledging the FUNCTIONAL FAIL SAFE state

A positive edge triggers the reset function.

Depending on the configuration of parameter "Automatic Reset at Startup", a positive edge may be necessary to get the SafeMOTION module from state INIT to state OPERATIONAL after startup.

Relevant configuration parameters

Group: General settings - Automatic reset on start (previously General Settings)

Parameter	Unit	Description		Default value	Used Starting in Safety Release
Automatic reset on start - En- Er	Enabled/	Activates automatic reset of the function block at startup		Disabled	R1.3
able	Disabled	Value	Description		
(previously Automatic Reset at Startup)		Enabled	After startup, the module automatically changes to state OPERATIONAL (Startreset). The reset input does not have to be controlled!		
		Disabled	After startup, the module remains in an Init state until a positive edge of the reset input is detected.		

Table 584: SafeMOTION parameter group: General settings - Automatic reset on start

Danger!

Parameter "Automatic reset on start" enables/disables the restart interlock during startup or when a network failure occurs on a reestablished network connection.

If parameter "Automatic reset on start" is set to "Enabled", then the module automatically changes to state OPERATIONAL state (i.e. pulse disabling and the motor holding brake are enabled)!

Configuring an automatic restart can result in critical safety conditions. Take additional measures to ensure proper safety-related functionality.

openSAFE-

8.6.4 S_Control_Activate

General function

• Enables the module-internal state machine for a safe axis on the SafeMOTION module to execute the selected safety function

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to enable the module-internal state machine for a safe axis on the SafeMOTION module to execute the selected safety function.

SAFETRUE

Starts the state machine of the safe axis, safety functions can be enabled.

SAFEFALSE

Sets the state machine of the safe axis to state IDLE

openSAFE-TY_BuR_Motion

8.6.5 S_Control_STO

General function

· Selects/Deselects safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO safety function.

SAFETRUE

The safety function is deselected. Safe pulse disabling is not active!

SAFEFALSE

The safety function is selected. Safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

• None

8.6.6 S_Control_SBC

General function

· Selects/Deselects safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SBC safety function.

SAFETRUE

The safety function is deselected. The motor holding brake output is enabled and can be used by the standard application.

SAFEFALSE

The safety function is selected. The motor holding brake output is switched to 0 V!

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - SBC (previously General Settings)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBC - Enable delay time	[µs]	Delay time between the SBC request and activation of the safety function	0	R 1.3
(previously Delay time to start SBC (us)				

Table 585: SafeMOTION parameter group: Basic functions - SBC

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

8.6.7 S_Control_SS1

General function

· Selects/Deselects safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS1 safety function.

SAFETRUE

The safety function is deselected. SS1 is not active!

SAFEFALSE

The safety function is selected. Safe pulse disabling is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 586: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

openSAFE-TY_BuR_Motion_SF

Group: Basic functions - SS1 (previously General Settings)

Parameter	Unit	Descrip	tion	Default value	Starting in Safety Release
SS1 - Ramp monitoring - Enable (previously <i>Rampmonitoring for SS1</i>)	Enabled/ Disabled	addition	s ramp-based monitoring (in to time-based monitoring) s SS1 function is requested		R 1.3
		Value	Description		
		En- abled	When transitioning to the safe state of the SS1 function, a deceleration ramp is monitored in addition to the configurable time.		
		Dis- abled	When transitioning to the safe state of the SS1 function, only a configurable time is monitored.		
SS1 - Ramp monitoring - Time (previously Ramp Monitoring Time for SS1 (us))	[he]	Decelera SS1	ation ramp monitoring time for	0	R 1.3

Table 587: SafeMOTION parameter group: Basic functions - SS1

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	Deceleration ramp below the lower lin "Early limit monitor falls below the end amount of time, the vated prematurely		R 1.3	
		Value Description			
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[he]		the speed must be below the target speed limit in order to ne deceleration ramp and to assume the safety function's		R 1.3

Table 588: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

To use this function without safe encoder evaluation, "Ramp monitoring for SS1" and "Early Limit Monitoring" must be disabled.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \le LIM_{SLS4} \le LIM_{SLS3} \le LIM_{SLS2} \le LIM_{SLS1} \le LIM_{SMS} < EUS$ - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

openSAFE-TY BuR Motion

8.6.8 S_Control_STO1

General function

· Selects/Deselects safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the STO1 safety function.

SAFETRUE

The safety function is deselected. Safe pulse disabling is not active!

SAFEFALSE

The safety function is selected. Depending on the configuration, the high-side or low-side of safe pulse disabling is active! Torque/Power are switched off on the drive.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Basic functions - STO1 (previously General Settings)

Parameter	Unit	Description		Default value	Starting in Safety Release
STO1 - Channel	el High-side/		Selects the high-side or low-side IGBT in the STO1 function		R 1.3
(previously Channel selection for One Channel STO (STO1))	Low-side Value High-side	Value	Description		
		High-side	The high-side IGBTs are actuated with the function STO1.		
		Low-side	The low-side IGBTs are actuated with the function STO1.		

Table 589: SafeMOTION parameter group: Basic functions - STO1

8.6.9 S_Control_SOS

General function

· Selects/Deselects safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SOS safety function.

SAFETRUE

The safety function is deselected. Standstill tolerances are not being monitored.

SAFFFALSE

The safety function is selected. Standstill tolerances are being monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 590: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

 $LIM_{SOS} \leq LIM_{SLS4} \leq LIM_{SLS3} \leq LIM_{SLS2} \leq LIM_{SLS1} \leq LIM_{SMS} < EUS - Maximum speed to normalize speed range$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

8.6.10 **S_Control_SS2**

General function

· Selects/Deselects safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SS2 safety function.

SAFETRUE

The safety function is deselected. SS2 is not active!

SAFEFALSE

The safety function is selected. Standstill monitoring is activated after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description	Description [Starting in Safety Release
SLS - Ramp monitoring - Enable	Enabled/ Disabled	Activates ramp-bathe SLS function is	sed monitoring (in addition to time-based monitoring) when s requested	Enabled	R 1.3
		Value	Description		
(previously Rampmonitoring for SLS)	Enabled	Enabled	When changing to the safe state of the SLS function, a deceleration ramp is also monitored, in addition to the configurable time		
		Disabled	When changing to the safe state of the SLS function, only a configurable time is monitored		
SLS3 - Speed limit (previously Safe Speedlimit 3 for SLS (units/s))	[units/s]	Speed limit 3 for S	Speed limit 3 for SLS (SLS3)		R 1.3
SLS3 - Ramp monitoring - Time	[µs]	Deceleration ramp monitoring time for SLS3		0	R 1.3
(previously Ramp Monitoring Time for SLS3 (us))					

Table 604: SafeMOTION parameter group: Speed functions - SMS/SLS

Group: General settings - Early limit monitoring (previously Early Limit Monitoring)

Parameter	Unit	Description		Default value	Starting in Safety Re- lease
Early limit monitoring - Enable (previously <i>Early Limit Monitoring</i>)	Enabled/ Disabled	below the lower line "Early limit monitor falls below the endamount of time, the vated prematurely	ring": If the current speed during the deceleration process d speed limit of the activated safety function for a defined nen the safe state of the respective function will be acti-		R 1.3
		Value	Description		
		Enabled	"Early Limit Monitoring" is active!		
		Disabled	"Early Limit Monitoring" is not active!		
Early limit monitoring - Time (previously Early Limit Monitoring time (us))	[he]		the speed must be below the target speed limit in order to ne deceleration ramp and to assume the safety function's		R 1.3

Table 605: SafeMOTION parameter group: General settings - Early limit monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

If several safety functions are active, then the lowest speed limit is always the value being monitored.

The following application rule must be observed:

LIM_{SOS} ≤ LIM_{SLS4} ≤ LIM_{SLS3} ≤ LIM_{SLS2} ≤ LIM_{SLS1} ≤ LIM_{SMS} < EUS - Maximum speed to normalize speed range

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

8.6.15 S_Control_SLS-4

General function

· Selects/Deselects safety function Safely Limited Speed, Speed Limit 4

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLS4 safety function.

SAFETRUE

The safety function is deselected. SLS4 is not active!

SAFEFALSE

The safety function is selected. Speed limit 4 is monitored after the end of ramp monitoring.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
(previously Deceleration Ramp [units/s²])				
Ramp monitoring - Enable de- lay time	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3
(previously Delay time to start ramp monitoring (us))				

Table 606: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

openSAFE-TY_BuR_Motion_8

Group: Speed functions - SMS/SLS (previously Safety Speed Limits)

Parameter	Unit	Description		Default value	Starting in Safety Release

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

8.6.16 S_Control_SDI-P

General function

· Selects/Deselects safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the safety function SDI, movement is allowed in the positive direction of movement.

SAFETRUE

The safety function is deselected. SDI is not active!

SAFEFALSE

The direction of movement is monitored after the delay time has expired. Movement is allowed in the positive direction.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description		Starting in Safety Re- lease
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously Position Tolerance (units))				

Table 609: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SDI (previously Safety Additional Parameters)

Parameter	Unit	Description	Default value	Starting in Safety Release
SDI - Enable delay time	[µs]	Delay time between the SDI request and activation of the safety function	0	R 1.3
(previously Delay time to start SDI (us)

openSAFE-FY_BuR_Motion_SI

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

8.6.18 S_Control_SLI

General function

· Selects/Deselects safety function Safely Limited Increment, SLI

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLI safety function.

SAFETRUE

The safety function is deselected. SLI is not active!

SAFEFALSE

The safety function is selected. A safe range of increments is monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				

Table 613: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Group: Advanced functions - SLI (previously Safely Limited Increment)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLI - Position limit (previously Safe Increments (units))	[units]	Maximum movable increments when SLI is active	0	R 1.3
SLI - Disable delay time (previously SLI Off Delay (µs))	[µs]	Switch off delay of SLI	0	R 1.3

Table 614: SafeMOTION parameter group: Advanced functions - SLI

openSAFE-

Danger!

The maximum increment range must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

8.6.19 S_Control_SBT

General function

· Selects/Deselects safety function Safe Brake Test, SBT

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to start the SBT safety function.

Negative edge

A negative edge (state transition from SAFETRUE to SAFEFALSE on input parameter "S_Control_SBT") starts safety function Safe Brake Test, SBT.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Advanced functions - SBT (previously Safe Brake Test) (only available for ACOPOSmulti SafeMOTION SinCos and ACOPOS P3 SafeMOTION (hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in Safety Release
SBT - Threshold (previously Safe Brake Test threshold (uA))	[μΑ]	Threshold value for the stator current that must be exceeded during the brake test	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - External load (previously Safe Brake Test external load (uA))	[µA]	External load	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Position tolerance (previously Safe Brake Test position tolerance (units))	[units]	Position tolerance	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Maximum torque duration (previously Safe Brake Test maximum torque duration (us))	[µs]	Duration of the test for which the maximum torque must be present	0	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Test interval (previously Safe Brake Test interval (s))	[s]	Retry interval for the safe brake test	28800	R 1.7 SinCos R 1.10 ACOPOS P3
SBT - Enable delay time (previously <i>Delay Time to start</i> SBT (us))	[µs]	Delay time between the SBT request and activation of the safety function	0	R 1.7 SinCos R 1.10 ACOPOS P3

Table 615: SafeMOTION parameter group: Advanced functions - SBT

Information:

This safety function requires safe evaluation of the position and speed. If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

8.6.20 S_Control_SLT

General function

· Selects/Deselects safety function Safely Limited Torque, SLT

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLT safety function.

SAFETRUE

The safety function is deselected. SLT is not active!

SAFEFALSE

The safety function is selected. The configured motor torque limit is monitored.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Advanced functions - SLT (only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in
				Safety Re-
SLT - Torque limit	[mNm]	Torque limitation monitored during activation of SLT	0	R 1.10
SLT - Enable delay time	[µs]	Delay time between the SLT request and activation of the safety function	0	R 1.10

Table 616: SafeMOTION parameter group: Advanced functions - SLT

Group: General settings - Motor (only available for ACOPOS P3 SafeMOTION in hardware upgrade 1.10.2.x or later)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Motor - Number of pole pairs (hardware upgrade 1.10.2.x and later)	-	Number of pole pairs on the rotor circumference	1	1.10
Motor - Direction*) (hardware upgrade 1.10.2.x and later)	Standard / Inverse	Direction of rotation of the motor	Standard	1.10
Motor - Stator resistance (hardware upgrade 1.10.2.x and later)	mOhm	Ohmic stator resistance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Stator inductance (hardware upgrade 1.10.2.x and later)	μH	Stator inductance measured between two connections (phase - phase) of the motor	0	1.10
Motor - Torque constant (hardware upgrade 1.10.2.x and later)	μNm / A	Torque constant of the motor	0	1.10
Motor - Rated speed (hardware upgrade 1.10.2.x and later)	units/s	Nominal speed of the motor	0	1.10
Motor - Stall current (hardware upgrade 1.10.2.x and later)	mA	Stall current of the motor	0	1.10
Motor - Rated current (hardware upgrade 1.10.2.x and later)	mA	Nominal current of the motor	0	1.10
Motor - Peak current (hardware upgrade 1.10.2.x and later)	mA	Peak current of the motor	0	1.10

Table 617: SafeMOTION parameter group: General settings - Motor

SafeMOTION User's Manual V 4.6.1

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_BR

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Motor - Stall torque (hardware upgrade 1.10.2.x and later)	mNm	Stall torque of the motor that is output when the stall current is applied	0	1.10
Motor - Peak torque (hardware upgrade 1.10.2.x and later)	mNm	Peak torque of the motor that is briefly output when the peak current is applied	0	1.10
Motor - Moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	Mass moment of inertia of the motor. Consists of the sum of the inertias of the rotor, encoder and holding brake.	0	1.10
Motor - External moment of inertia (optional) (hardware upgrade 1.10.2.x and later)	µkgm²	External mass moment of inertia, depends on the total external load	0	1.10

Table 617: SafeMOTION parameter group: General settings - Motor

^{*)} The direction of rotation of the motor is not related to the counting direction of the speed ("EUS - Counting direction"), i.e. the direction of rotation of the motor can be changed explicitly in the non-safe application and must therefore also be taken into account in SafeDESIGNER.

8.6.21 S_Control_Homing

General function

· Selects/Deselects safety function "Safe Homing"

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to start a "Safe Homing" procedure. A positive edge of the input starts the safety function.

Positive edge: Change from SAFEFALSE to SAFETRUE

Starts "Safe Homing".

Negative edge: Change from SAFETRUE to SAFEFALSE

If still active, the homing procedure will be terminated by the negative edge. This state transition has no effect if the homing procedure has already been completed.

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: Absolute position functions - Homing (previously Homing)

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Mode	Direct / Reference switch /	Selects the homing mode	Direct	R 1.4
(previously <i>Mode</i>)	Home Offset / Home offset with cor- rection	Modes "Home offset" and "Home offset with correction" are only available for ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		
Homing - Home position or home offset	[units]	Home position or home offset	0	R 1.4
(previously Home Position or Home Offset (units))				
Homing - Enable RSP (Remanent safe position)	Enabled/ Disabled	Selects whether or not to use the remanent safe position This parameter is only available with ACOPOSmulti SafeMOTION EnDat	Disabled	R 1.9
(previously Remanent safe position)		2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		
Homing - Edge of reference switch (previously <i>Edge of reference</i> <i>switch</i>)	Positive / Negative	Selects the switching edge for the reference switch The switching edge for the reference switch input is positive if the logical state of the reference switch changes from SAFEFALSE to SAFETRUE in the positive direction of movement.	Positive	R 1.4
Homing - Trigger direction	Positive / Negative	Selects the trigger direction If the homing procedure requires a movement, then this parameter spec-	Positive	R 1.4
(previously <i>Trigger direction</i>)		ifies the direction for evaluating the reference switch / reference pulse.		

Table 618: SafeMOTION parameter group: Absolute position functions - Homing

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_BR

Parameter	Unit	Description	Default value	Starting in Safety Release
Homing - Enable reference pulse (previously Reference pulse)	Enabled/ Disabled	Selects whether or not to use a reference pulse for homing This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!	Disabled	R 1.4
Homing - Blocking distance (previously Blocking distance (% encoder reference system))	%	Distance within which evaluation of the reference pulse will be suppressed. This is calculated starting at the configured reference switch edge and indicated as a percentage of the encoder reference system. A single revolution is used as the encoder reference system for rotary encoders. This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2, ACOPOS P3 SafeMOTION and ACOPOSmotor SafeMOTION!		R 1.4
Homing - Maximum trigger speed (previously Max. trigger speed (units/s))	[units/s]	Maximum permissible speed for evaluating the reference switch / reference pulse	0	R 1.4
Homing - Monitoring time (previously <i>Homing Monitoring Time</i> (μs))	[µs]	Monitoring time for the homing procedure	0	R 1.4

Table 618: SafeMOTION parameter group: Absolute position functions - Homing

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The Safe Homing function is needed in order to implement the safety functions SLP and SMP and for using the safe position.

The "SafePositionValid" status bit will remain set to SAFEFALSE until safe homing has been performed!

8.6.22 S_Control_RefSwitch

General function

· Reference switch input for safety function "Safe Homing"

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter serves as a reference switch input for the "Safe Homing" safety function and is only evaluated in the "Reference Switch" homing mode.

The status of a safe reference switch that was read into the safety application via a safe input module (X20SIxxxx), for example, should be linked to the input.

Not connected

The reference switch is not being used!

Information:

If "Reference Switch" homing mode is configured and the reference switch input "S_ReferenceSwitch" is not wired on the function block, then the SafeMOTION module will switch to the FAIL SAFE state. The only way to exit the FAIL SAFE state is to complete a power off/on cycle and modify the safety application!

Information:

Input "S_Control_RefSwitch" is only evaluated in homing mode "Reference Switch". The input is ignored in other homing modes!

openSAFE-TY_BuR_Motion_SF

8.6.23 S_Control_SwitchHomingMode

General function

• This input is used by safety function "Remanent Safe Position" and enables a homing procedure that confirms the remanent safe position.

Data type

SAFEBOOL

Connection

Variable

Function description

This input parameter is used to switch between homing with RSP and the configured homing mode.

SAFETRUE

When a homing command is given (i.e. positive edge on input "S_Control_RequestHoming"), then homing mode "Homing with RSP" is used.

SAFEFALSE

When a homing command is given (i.e. positive edge on input "S_Control_RequestHoming"), then the configured homing mode is used.

Relevant configuration parameters

_	•			
Parameter	Unit	Description	Default value	
Homing				
Remanent Safe Position	Enabled/ Disabled	Selects whether or not to use the remanent safe position	Disabled	
		This parameter is only available with ACOPOSmulti SafeMOTION EnDat 2.2!		
Safety Standstill and Direction Tolerances				
Speed Tolerance	[units/s]	Speed tolerance for standstill monitoring	0	
Position Tolerance	[units]	Position tolerance for standstill and direction monitoring	0	

Table 619: RSP safety function - Parameters

8.6.24 S_Control_SLP

General function

· Selects/Deselects safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

· Constant or variable

Function description

This input parameter is used to select or deselect the SLP safety function.

SAFETRUE

The safety function is deselected. SLP is not active!

SAFEFALSE

The configured position window will be safety-monitored after "Delay time to start SLP (us)".

Not connected

The safety function is deactivated.

Relevant configuration parameters

Group: General settings - Ramp monitoring (previously Safety Deceleration Ramp)

Parameter	Unit	Description	Default value	Starting in Safety Release
Ramp monitoring - Speed deceleration limit (previously Deceleration Ramp [units/s²])	[units/s²]	Slope of the deceleration ramp to be monitored	1073676289	R 1.3
	[µs]	Delay time between the request for ramp-based monitoring and the start of monitoring	0	R 1.3

Table 620: SafeMOTION parameter group: General settings - Ramp monitoring

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: Absolute position functions - SMP/SLP (previously Safety Position Limits)

Parameter	Unit	Description	Default value	Starting in Safety Release
SLP - Lower position limit (previously Safe Lower Position Limit for SLP (units))	[units]	Lower position limit for the monitoring range	0	R 1.4
SLP - Upper position limit (previously Safe Upper Position Limit for SLP (units))	[units]	Upper position limit for the monitoring range	0	R 1.4
SLP - Enable delay time (previously <i>Delay time to start</i> SLP (us))	[µs]	Delay time between the SLP request and start of monitoring	0	R 1.4

Table 621: SafeMOTION parameter group: Absolute position functions - SMP/SLP

SafeMOTION User's Manual V 4.6.1

Danger!

The position limits being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement, a dangerous movement cannot occur in the event of a worst case scenario.

The dangerous movement must be determined by a risk analysis.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

If this rule is not adhered to, then the SafeMOTION module immediately switches to the FAIL SAFE state after startup. The application must be set accordingly in SafeDESIGNER!

Danger!

The delay parameters cause a delay before the safety function is started. This delay must be taken into account when determining the intervals and performing the risk analysis!

Group: General settings - Standstill monitoring (previously Safety Standstill and Direction Tolerances)

Parameter	Unit	Description	Default value	Starting in Safety Re- lease
Standstill monitoring - Speed tolerance	[units/s]	Speed tolerance for standstill monitoring (SOS)	0	R 1.3
(previously Speed Tolerance (units/s))				
Standstill monitoring - Position tolerance	[units]	Position tolerance for standstill and direction monitoring	0	R 1.3
(previously <i>Position Tolerance</i> (units))				

Table 622: SafeMOTION parameter group: General settings - Standstill monitoring

Danger!

The speed limit and position limit being monitored must be set in such a manner that, with consideration for the error response time and the resulting movement in the worst case scenario, a dangerous movement cannot occur in the event of error.

The dangerous movement must be determined by a risk analysis.

Information:

This safety function requires safe evaluation of the position and speed.

If an evaluation error is detected, then the SafeMOTION module switches to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

Information:

The following application rule must be observed:

 $LIM_{SMP,NEG} \le LIM_{SLP,POS} \le LIM_{SMP,POS}$

Failure to follow the application rule will cause the SafeMOTION module to enter the FAIL SAFE state. If this occurs, it can only be brought back to the OPERATIONAL state by modifying the safety application and completing a power off/on cycle!

Information:

Safe homing of the axis must be completed prior to using this safety function.

If a homing procedure is not completed successfully or the "S_SafePositionValid" status changes, then the request for the SLP safety function causes the module to switch to the acknowledgeable FUNCTIONAL FAIL SAFE error state.

The drive loses all torque/power and coasts to a stop! In the event of an error, a synchronous axis will no longer be synchronous. The output of function block "S_NotErrFUNC" is reset.

openSAFE-Y_BuR_Motion_S

8.6.25 S_AxisID

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

If function block SF_oS_MOTION_BR is used in SafeDESIGNER, then the same "S_AxisID" is not permitted to be simultaneously used with function block SF_oS_MOTION_Basic_BR, SF_oS_MOTION_Speed_BR, SF_oS_MOTION_Advanced_BR or SF_oS_MOTION_AbsPos_BR!

8.7 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

8.7.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

General function

Information about the error state of the safe axis of the SafeMOTION module

Data type

SAFEBOOL

Connection

· Variable

Function description

This output parameter specifies the error state of the safe axis of the SafeMOTION module.

SAFETRUE

No error was found on the SafeMOTION module.

SAFEFALSE

An error (e.g. exceeding a monitored limit) has been detected on the safe axis of the SafeMOTION module or the function block has not been activated.

In the event of an error, see the Safety Logger in Automation Studio for additional information about the error. If the error is a functional error, then it can be acknowledged by changing the signal on input "S_Control_Reset" from SAFEFALSE to SAFETRUE (positive edge)!

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_Status_NotErrFUNC" does not represent the functional safe state of the SafeMOTION module!

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

openSAFE-TY_BuR_Motion_SF

8.7.3 S_Status_Operational

General function

· Information about the status of the state machine of the safe axis

Data type

SAFEBOOL

Connection

· Variable

Function description

This output parameter specifies the status of the state machine of the safe axis.

SAFETRUE

The state machine is in state OPERATIONAL.

SAFEFALSE

The state machine is not in state OPERATIONAL.

openSAFE-TY_BuR_Motion_3

8.7.4 S_Status_STO

General function

· Status information for safety function Safe Torque Off, STO

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO safety function

SAFETRUE

The STO safety function is active and currently in its safe state.

SAFEFALSE

8.7.5 S_Status_SBC

General function

· Status information for safety function Safe Brake Control, SBC

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SBC safety function

SAFETRUE

The SBC safety function is active and currently in its safe state.

SAFEFALSE

openSAFE-

8.7.6 S_Status_SS1

General function

· Status information for safety function Safe Stop 1, SS1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS1 safety function

SAFETRUE

The SS1 safety function is active and currently in its safe state.

SAFEFALSE

8.7.7 S_Status_STO1

General function

· Status information for safety function Safe Torque Off, One Channel, STO1

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the STO1 safety function

SAFETRUE

The STO1 safety function is active and currently in its safe state.

SAFEFALSE

openSAFE-TY_BuR_Motion

8.7.8 S_Status_SDC

General function

· Information about the status of ramp monitoring

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the status of ramp monitoring.

SAFETRUE

Ramp monitoring is active.

SAFEFALSE

Ramp monitoring is not active. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

Danger!

This signal should only be used for status information.

8.7.9 S_Status_EncStatus

General function

· Information about the error state of the safe encoder signal

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the error state of the signal for a defined safe encoder.

If an encoder error is detected or the SafeMOTION module is in an error state, then the output is set to SAFEFALSE. This state is maintained until the error has been corrected.

SAFETRUE

An error was not detected on the encoder signal.

SAFEFALSE

The encoder signal from a defined safe axis is faulty, or the axis itself is in an error state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled. For more information about the error, see the Safety Logger in Automation Studio.

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_Status_EncStatus" does not represent the functional safe state of the SafeMOTION module!

8.7.10 S_Status_SOS

General function

· Status information for safety function Safe Operating Stop, SOS

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SOS safety function

SAFETRUE

The SOS safety function is active and currently in its safe state.

SAFEFALSE

8.7.11 S_Status_SS2

General function

· Status information for safety function Safe Stop 2, SS2

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SS2 safety function

SAFETRUE

The SS2 safety function is active and currently in its safe state.

SAFEFALSE

8.7.12 S_Status_SLA

General function

· Status information for safety function Safely Limited Acceleration, SLA

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLA safety function

SAFETRUE

The SLA safety function is active and currently in its safe state.

SAFFFALSE

8.7.13 S_Status_SLS-1

General function

• Status information for safety function Safely Limited Speed, Speed Limit 1 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS1 safety function

SAFETRUE

The SLS1 safety function is active and currently in its safe state.

SAFEFALSE

8.7.14 S_Status_SLS-2

General function

• Status information for safety function Safely Limited Speed, Speed Limit 2 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS2 safety function

SAFETRUE

The SLS2 safety function is active and currently in its safe state.

SAFEFALSE

8.7.15 S_Status_SLS-3

General function

• Status information for safety function Safely Limited Speed, Speed Limit 3 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS3 safety function

SAFETRUE

The SLS3 safety function is active and currently in its safe state.

SAFEFALSE

8.7.16 S_Status_SLS-4

General function

• Status information for safety function Safely Limited Speed, Speed Limit 4 (SLS-1)

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLS4 safety function

SAFETRUE

The SLS4 safety function is active and currently in its safe state.

SAFEFALSE

8.7.17 S_Status_SDI-P

General function

• Status information for safety function Safe Direction. Movement is allowed in the positive direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIpos safety function

SAFETRUE

The SDIpos safety function is active and currently in its safe state.

SAFEFALSE

8.7.18 S_Status_SDI-N

General function

• Status information for safety function Safe Direction. Movement is allowed in the negative direction.

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SDIneg safety function

SAFETRUE

The SDIneg safety function is active and currently in its safe state.

SAFEFALSE

8.7.19 S_Status_SLI

General function

· Status information for safety function Safely Limited Increment

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLI safety function

SAFETRUE

The SLI safety function is active and currently in its safe state.

SAFFFALSE

8.7.20 S_Status_SBT

General function

· Additional information for testing the holding brake with Safe Brake Test

Data type

SAFEBOOL

Connection

Variable

Function description

Returns the status of the holding brake test with Safe Brake Test, SBT

SAFETRUE

The SBT safety function has been executed. The status of the testing is valid.

SAFEFALSE

The SBT safety function has not been executed. The status of the testing is invalid or expired.

8.7.21 S_Status_SBT-Active

General function

Additional information for testing the holding brake with Safe Brake Test

Data type

SAFEBOOL

Connection

Variable

Function description

Returns the status of the holding brake test with Safe Brake Test, SBT

SAFETRUE

Testing of the holding brake with SBT is being executed.

SAFEFALSE

Testing of the holding brake with SBT is not requested.

8.7.22 S_Status_SLT

General function

· Status information for safety function Safely Limited Torque

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLT safety function

SAFETRUE

The SLT safety function is active and currently in its safe state.

SAFEFALSE

8.7.23 S_Status_Homing

General function

· Status information for safety function "Safe Homing" and the safe position

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether or not safe homing of the axis has been completed and whether or not the position signal is valid.

SAFETRUE

The axis has been safely homed, and the safe position is valid.

SAFEFALSE

The axis has not yet been successfully homed; the encoder signal of the axis is faulty. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled. The safe position is invalid!

Danger!

The purpose of this signal is only to provide additional information.

"S_Status_Homing" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of output parameter "S_SafePosition_4Byte" is only valid if output parameter S_SafePositionValid is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

8.7.24 S_Status_ReqHomingOK

General function

· Feedback for homing in SafeDESIGNER

Data type

SAFEBOOL

Connection

Variable

Function description

This status is set to provide feedback in the event that homing is requested when already in a homed state ("S_Control_Homing" and "S_Status_Homing" are set).

SAFETRUE

The input for homing is set ("S_Control_Homing" = SAFETRUE), and the safe position is valid ("S_Status_Homing" = SAFETRUE).

SAFEFALSE

The input for homing is not set or the safe position is not valid. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

8.7.25 S_Status_EncStatus2

General function

· Information about the error state of the safe encoder signal

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the error state of the signal for a defined safe encoder.

If an encoder error is detected or the SafeMOTION module is in an error state, then the output is set to FALSE. This state is maintained until the error has been corrected.

SAFETRUE

An error was not detected on the encoder signal.

SAFEFALSE

The encoder signal from a defined safe axis is faulty, or the axis itself is in an error state. For more information about the error, see the Safety Logger in Automation Studio.

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_Status_EncStatus2" does not represent the functional safe state of the SafeMOTION module!

openSAFE-

8.7.26 S_Status_SLP

General function

· Status information for safety function Safely Limited Position, SLP

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SLP safety function

SAFETRUE

The SLP safety function is active and currently in its safe state.

SAFEFALSE

8.7.27 S_Status_SMP

General function

· Status information for safety function Safe Maximum Position, SMP

Data type

SAFEBOOL

Connection

Variable

Function description

Indicates the functional safe state of the SMP safety function

SAFETRUE

The SMP safety function is active and currently in its safe state.

SAFEFALSE

Monitoring of the SMP position limits is not active. Monitoring is not yet active since the SafeMOTION module has not yet been homed. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

8.7.28 S_Status_RSPValid

General function

• Status information for the "Remanent safe position" safety function

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the following:

- The current safe position has been homed, validated and saved.
- Changes to the safe position are prevented by the active STO and SOS safety functions.
- Powering off the module does not result in loss of the safe remanent position.

SAFETRUE

The safe position has been saved successfully. Power off for homing with RSP is possible in this state.

SAFEFALSE

One or more of the following is true:

- The axis was not successfully homed. (The state of "S_Status_Homing" is not TRUE.)
- The STO safety function is not selected/active.
- The SOS safety function is not selected/active.
- The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

8.7.29 S_Status_SetPosAlive

General function

· Status information about plausibility check of the position setpoint

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether the plausibility of the position setpoint has been checked.

SAFETRUE

The plausibility of the position setpoint was checked successfully.

SAFEFALSE

The plausibility of the position setpoint was faulty or not checked. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

openSAFE-

8.7.30 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on input "S_Control_Reset" must change from SAFE-FALSE to SAFETRUE (positive edge).

8.7.31 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

8.7.32 Overview of diagnostic codes

Diagnostic codes

Code (hex)	Description	Corrective measures
0000	The function block is not enabled.	Enable the function block by setting "Activate" to SAFETRUE.
	If "Activate" is connected to a variable that indicates the state of the connected safe device (active, inactive or peripheral fault detected), then the safe device is not active or has detected a fault in the connected peripheral.	 Enable the safe device if "Activate" is connected to a variable that indicates the state of a connected safe device (active, inactive or peripheral fault detected), or correct the fault in the peripheral according to the device description.
8000	The function block detected neither a status nor an error to set the enable output to SAFEFALSE.	 If this is a desired signal combination at the signal inputs, no action is required.
		 If the signal combination on the signal inputs is unintended, check the connected peripheral and correct any faults.
C001	The function set for the control byte was not found.	Check whether the required safety function is supported by the connected axis.
C002	The function set for the status byte was not found.	Check whether the required safety function is supported by the connected axis.
C003	The function set ID that was read does not match.	Check whether the required safety function is supported by the connected axis.
C004	The data length of the function set that was read is invalid.	Check whether the required safety function is supported by the connected axis.
C005	The status byte could not be read.	Check whether the required safety function is supported by the connected axis.
C006	The control byte could not be written.	Check whether the required safety function is supported by the connected axis.

Table 623: SF_oS_MOTION_(Basic, Speed, Advanced, AbsPos)_BR: Diagnostic codes

8.8 Signal sequence diagram of the function block

A general signal sequence diagram of the function block cannot be specified since it depends on which safety functions are selected or deselected.

See 4 "SafeMOTION user's manual / Safety technology / Integrated safety functions" on page 322.

9 SF_oS_MOTION_ScaledSpeed_BR

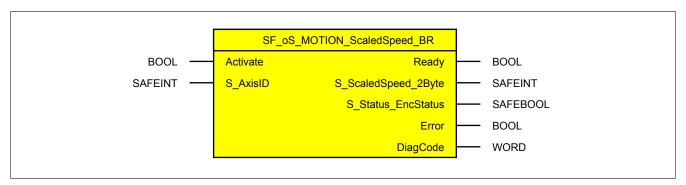

Figure 127: Function block SF_oS_MOTION_ScaledSpeed_BR

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR to be applied to each axis being used in the safety application. Otherwise, the internal state machine of the axis remains in state IDLE, and pulse disabling and the holding brake output cannot be enabled.

Alternatively, function block SF_oS_MOTION_BR can be used; it represents the combination of all available function sets.

9.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/	State	FALSE	Enables the function block (= TRUE)
		Constant			Input "Activate" according to the PLCopen standard
S_AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 624: SF_oS_MOTION_ScaledSpeed_BR: Overview of input parameters

1) Evaluation of the input parameter signals in the function block. You must control the signals accordingly.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled Output "Ready" according to the PLCopen standard
S_ScaledSpeed_2Byte	SAFEINT	Variable	Value	-	Scaled safe speed
S_Status_EncStatus	SAFEBOOL	Variable	State	SAFEFALSE	No encoder error has been detected (i.e. SAFETRUE), signal "S_ScaledSpeed" is valid.
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message

Table 625: SF_oS_MOTION_ScaledSpeed_BR: Overview of output parameters

1) Output of the output parameter signals. You must evaluate and/or further process the signals accordingly.

Туре	Description	Size in bits	Format option
BOOL	Bit	1	Bit string
WORD	Word	16	Bit string
DINT	Double integer	32	Binary number, hexadecimal number, signed decimal number
SAFEBOOL	Bit	1	Bit string (signal source: safe device)
SAFEDWORD	Double word	32	Bit string (signal source: safe device)
SAFEDINT	Double integer	32	Binary number, hexadecimal number, signed decimal number (signal source: safe device)
SAFEINT	Integer	16	Binary number, hexadecimal number, signed decimal number (signal source: safe device)

Table 626: Format description of the data types

9.2 Function

The primary purpose of function block SF_oS_MOTION_ScaledSpeed_BR is to establish a connection between the safe speed of an axis and the associated encoder error status. An assignment is then made to a defined safe axis.

Function block SF_oS_MOTION_ScaledSpeed_BR can be used to process the current safe speed of an axis in the safety application.

Danger!

Make sure that the correct "AxisID" is always used on the input! Each assignment must be validated separately.

To ensure valid evaluation of the speed signal, the corresponding encoder error status bit must also always be checked.

The speed signal itself is only considered valid if this output parameter is set to SAFETRUE.

Danger!

If the speed signal is not validated, then an invalid speed value could be used in the safety application. This can result in hazardous situations!

openSAFETY_BuR_Motion_SF • SF_oS_MOTION_ScaledSpeed_BR

9.3 Safe encoder connection

See 2.3.3 "Safe encoder connection" on page 304.

9.4 Fault avoidance

See 3.4 "Fault avoidance" on page 497.

9.5 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

9.5.1 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.
All binary output parameters are set to FALSE.
Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

9.5.2 **S_AxisID**

General function

• This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and function block SF_oS_MOTION_S-caledSpeed_BR in the safety application. Otherwise, it will not be possible to compile the safety application.

9.6 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

9.6.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

openSAFE-

9.6.2 S_ScaledSpeed_2Byte

General function

· Indicates the current value of the scaled safe speed

Data type

SAFEINT

Connection

Variable

Function description

This output parameter indicates the current value of the scaled safe speed for a real axis.

Danger!

The value of output parameter "S_ScaledSpeed_2BYTE" is valid if output parameter "S_Status_EncStaus" is SAFETRUE. Otherwise, it is invalid and not permitted to be used further!

9.6.3 S_Status_EncStatus

General function

· Information about the error state of the safe encoder signal

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the error state of the signal for a defined safe encoder.

If an encoder error is detected or the SafeMOTION module is in an error state, then the output is set to SAFEFALSE. This state is maintained until the error has been corrected.

SAFETRUE

An error was not detected on the encoder signal. The value of the safe speed on output "S_ScaledSpeed_2Byte" is valid.

SAFEFALSE

The encoder signal from a defined safe axis is faulty, or the axis itself is in an error state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled. For more information about the error, see the Safety Logger in Automation Studio.

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

S Status EncStatus does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of output S_ScaledSpeed_2Byte is valid if output S_ Status_EncStatus is SAFETRUE. Otherwise, it is invalid and not permitted to be used further!

9.6.4 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on input "S_Control_Reset" must change from SAFE-FALSE to SAFETRUE (positive edge).

9.6.5 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

9.6.6 Overview of diagnostic codes

Diagnostic codes

Code (hex)	Description	Corrective measures
0000	The function block is not enabled.	Enable the function block by setting "Activate" to SAFETRUE.
	If "Activate" is connected to a variable that indicates the state of the connected safe device (active, inactive or peripheral fault detected), then the safe device is not active or has detected a fault in the connected peripheral.	 Enable the safe device if "Activate" is connected to a variable that indicates the state of a connected safe device (active, inactive or peripheral fault detected), or correct the fault in the peripheral according to the device description.
8000	The function block detected neither a status nor an error to set the enable output to SAFEFALSE.	 If this is a desired signal combination at the signal inputs, no action is required.
		 If the signal combination on the signal inputs is unintended, check the connected peripheral and correct any faults.
8001	There is no function set for this instance ID. 2 or 4 bytes not read.	Check whether the required safety function is supported by the connected axis.
C001	Could not read back position value properly from axis.	Check whether the required safety function is supported by the connected axis.
C003	The function set ID that was read does not match.	Check whether the required safety function is supported by the connected axis.
C004	The data length of the function set that was read is invalid.	Check whether the required safety function is supported by the connected axis.
C005	Could not read 2 or 4 bytes.	Check whether the required safety function is supported by the connected axis.

Table 627: SF_oS_MOTION_ScaledSpeed_BR: Diagnostic codes

9.7 Signal sequence diagram of function block

A signal sequence diagram cannot be specified for this function block.

10 SF_oS_MOTION_Position_BR

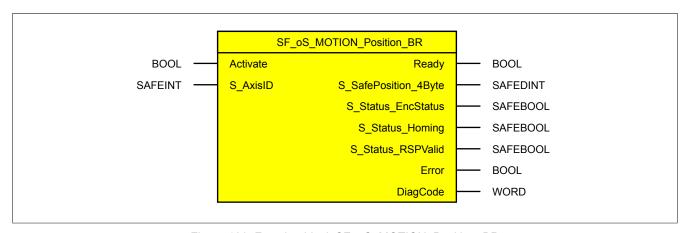

Figure 128: Function block SF_oS_MOTION_Position_BR

Information:

Library openSAFETY_BuR_Motion_SF can only be used to control ACOPOS P3 SafeMOTION servo drives.

Information:

It is mandatory for function block SF_oS_MOTION_Basic_BR to be applied to each axis being used in the safety application. Otherwise, the internal state machine of the axis remains in state IDLE, and pulse disabling and the holding brake output cannot be enabled.

Alternatively, function block SF_oS_MOTION_BR can be used; it represents the combination of all available function sets.

10.1 Formal parameters of the function block

In the following, the term "variable" refers to both a variable as well as a graphic connection.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Activate	BOOL	Variable/	State	FALSE	Enables the function block (= TRUE)
		Constant			Input "Activate" according to the PLCopen standard
S AxisID	SAFEINT	Constant	State	-1	Assigns an axis to the function block

Table 628: SF_oS_MOTION_Position_BR: Overview of input parameters

Evaluation of the input parameter signals in the function block. You must control the signals accordingly.

Name	Туре	Connection	Signal type 1)	Initial value	Description / General function
Ready	BOOL	Variable	State	FALSE	Indicates that the function block is enabled Output "Ready" according to the PLCopen standard
S SafePosition 4Byte	SAFEDINT	Variable	Value		Safe position in units
	SAI LUINI		value	-	'
S_Status_EncStatus	SAFEBOOL	Variable	State	SAFEFALSE	No encoder error has been detected (i.e. SAFETRUE), signal "S_ScaledSpeed_2Byte" is valid.
S_Status_Homing	SAFEBOOL	Variable	State	SAFEFALSE	Specifies whether the safe position is valid (i.e. SAFETRUE, homing procedure has completed successfully and there are no encoder errors)
S_Status_RSPValid	SAFEBOOL	Variable	State	SAFEFALSE	Validates and stores the remanent safe position (RSP) (TRUE = safe position is stored, power off for homing with RSP is now possible)
Error	BOOL	Variable	State	FALSE	Function block error message
DiagCode	WORD	Variable	State	16#0000	Function block diagnostic message

Table 629: SF_oS_MOTION_Position_BR: Overview of output parameters

Table 630: Format description of the data types

10.2 Function

The primary purpose of function block SF_oS_MOTION_Position_BR is to establish a connection between the safe position of an axis and the associated status. An assignment is then made to a defined safe axis.

Function block SF_oS_MOTION_Position_BR can be used to process the current safe position of an axis in the safety application.

Danger!

Make sure that the correct AxisID is always used on the input! Each assignment must be validated separately.

To ensure valid evaluation of the position signal, the corresponding status bit "S_Status_Homing" must also always be checked.

The position itself is only considered homed and valid if this output parameter is set to SAFETRUE.

Danger!

If the position signal is not validated, then an invalid position could be used in the safety application. This can result in hazardous situations!

10.3 Safe encoder connection

See 2.3.3 "Safe encoder connection" on page 304.

10.4 Fault avoidance

openSAFE-FY_BuR_Motion_SI

10.5 Input parameters

Information:

For detailed information about individual safety functions, see "SafeMOTION user's manual / chapter "Safety technology" / Integrated safety functions"!

10.5.1 Activate

General function

· Enables the function block

Data type

BOOL

Connection

· Constant or variable

Function description

This input parameter is used to activate the function block.

- When enabling or disabling safe devices, "Activate" must be linked to a variable that indicates the state (enabled or disabled) of the corresponding safe devices. This ensures that the function block does not output a triggered safety function as diagnostic information when a device is switched off.
- It is also possible to connect "Activate" to a constant (TRUE) in order to enable the function block.

TRUE

The function block is enabled.

FALSE

The function block is not enabled.

All binary output parameters are set to FALSE.

Sets the DiagCode diagnostic parameter to WORD#16#0000.

If you want to control function block diagnostics as needed in your diagnostic concept whenever error messages from safe devices and/or deactivated safe devices occur, connect "Activate" to a signal that indicates the status of the safe devices that are involved with the safety function supported by the function block. Form this signal using only safe devices whose I/O signals are connected to the function block via actual parameters. In this way, you prevent triggered safety functions from being reported by active safe devices. This measure is only used to control the diagnostic information from inactive safe devices in a defined manner.

openSAFE-Y_BuR_Motion_S

10.5.2 S_AxisID

General function

· This input parameter assigns a real axis to the function block.

Data type

SAFEINT

Connection

Constant

Function description

The corresponding axis can be connected to the input in SafeDESIGNER using drag-and-drop.

Information:

There is only permitted to be one combination of AxisID and SF_oS_MOTION_Position_BR in the safety application. Otherwise, it will not be possible to compile the safety application.

10.6 Output parameters

Output parameters provide information about the state of the SafeMOTION module and the individual safety functions.

10.6.1 Ready

General function

· Message: Function block is enabled/disabled.

Data type

• BOOL

Connection

Variable

Function description

This output parameter indicates whether the function block is enabled or not.

TRUE

The function block is enabled ("Activate" = TRUE). The output parameters indicate the current state of the safety function.

FALSE

The function block is not enabled ("Activate" = FALSE). The function block outputs are set to FALSE.

openSAFE-TY_BuR_Motion_3

10.6.2 S_SafePosition_4Byte

General function

· Indicates the current safe position in units

Data type

SAFEDINT

Connection

Variable

Function description

This output parameter indicates the current value of the safe position for a real axis in units.

Danger!

The value of output parameter "S_SafePosition_4Byte" is valid if output parameter "S_Status_EncStaus" is SAFETRUE. Otherwise, it is invalid and not permitted to be used further!

10.6.3 S_Status_EncStatus

General function

· Information about the error state of the safe encoder signal

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the error state of the signal for a defined safe encoder.

If an encoder error is detected or the SafeMOTION module is in an error state, then the output is set to SAFEFALSE. This state is maintained until the error has been corrected.

SAFETRUE

An error was not detected on the encoder signal.

SAFEFALSE

The encoder signal from a defined safe axis is faulty, or the axis itself is in an error state. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled. For more information about the error, see the Safety Logger in Automation Studio.

Danger!

The purpose of this signal is only to provide additional information. It only provides information in connection with the requested safety functions.

"S_Status_EncStatus" does not represent the functional safe state of the SafeMOTION module!

openSAFE TY_BuR_Motic

10.6.4 S_Status_Homing

General function

· Status information for safety function "Safe Homing" and the safe position

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter specifies whether or not safe homing of the axis has been completed and whether or not the position signal is valid.

SAFETRUE

The axis has been safely homed, and the safe position is valid.

SAFEFALSE

The axis has not yet been successfully homed; the encoder signal of the axis is faulty. The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled. The safe position is invalid!

Danger!

The purpose of this signal is only to provide additional information.

"S_Status_Homing" does not represent the functional safe state of the SafeMOTION module!

Danger!

The value of output parameter "S_SafePosition_4Byte" is only valid if output parameter S_SafePositionValid is SAFETRUE. Otherwise, it is invalid and is not permitted to be used further.

10.6.5 S_Status_RSPValid

General function

· Status information for the "Remanent safe position" safety function

Data type

SAFEBOOL

Connection

Variable

Function description

This output parameter indicates the following:

- The current safe position has been homed, validated and saved.
- Changes to the safe position are prevented by the active STO and SOS safety functions.
- Powering off the module does not result in loss of the safe remanent position.

SAFETRUE

The safe position has been saved successfully. Power off for homing with RSP is possible in this state.

SAFEFALSE

One or more of the following is true:

- The axis was not successfully homed. (The state of "S_Status_Homing" is not TRUE.)
- The STO safety function is not selected/active.
- The SOS safety function is not selected/active.
- The SafeMOTION module is in an error state or the state machine of the safe axis or the function block itself was not enabled.

openSAFE-Y_BuR_Motion_S

10.6.6 Error

General function

· Function block error message

Data type

BOOL

Connection

Variable

Function description

This formal parameter indicates a pending function block error message.

TRUE

The enabled function block detected an error. "DiagCode" indicates the error code.

FALSE

The function block is not enabled, or the enabled function block did not detect an error. "DiagCode" indicates the status.

Danger!

It is your responsibility to ensure that all necessary corrective measures are initiated after an error occurs since subsequent errors can result in a hazard!

In order to exit an error state ("Error" = TRUE), the signal on input "S_Control_Reset" must change from SAFE-FALSE to SAFETRUE (positive edge).

10.6.7 DiagCode

General function

· Function block diagnostic message

Data type

WORD

Connection

Variable

Function description

This output parameter is used to output diagnostic and status messages specific to the function block and make them available automatically to diagnostic tools.

These diagnostic tools cannot acknowledge diagnostic messages from function blocks. This is done exclusively in the **safety** application.

The function block indicates the presence of an error message on the "DiagCode" output via the "Error" output parameter.

Diagnostic code

The diagnostic code is specified as data type WORD. The values and meanings of these diagnostic codes are listed below.

In the event of status messages (0xxx_{hex}, 8xxx_{hex}), the function block sets "Error" to FALSE.

In the event of error messages (Cxxx_{hex}), the function block sets "Error" to TRUE.

openSAFE-TY_BuR_Motion_3

10.6.8 Overview of diagnostic codes

Diagnostic codes

Code (hex)	Description	Corrective measures
0000	The function block is not enabled. If "Activate" is connected to a variable that indicates the state of the connected safe device (active, inactive or peripheral fault detected), then the safe device is not active or has detected a fault in the connected peripheral.	
8000	The function block detected neither a status nor an error to set the enable output to SAFEFALSE.	If this is a desired signal combination at the signal inputs, no action is required.
		 If the signal combination on the signal inputs is unintended, check the connected peripheral and correct any faults.
8001	There is no function set for this instance ID. 2 or 4 bytes not read.	Check whether the required safety function is supported by the connected axis.
C001	Could not read back position value properly from axis.	Check whether the required safety function is supported by the connected axis.
C003	The function set ID that was read does not match.	Check whether the required safety function is supported by the connected axis.
C004	The data length of the function set that was read is invalid.	Check whether the required safety function is supported by the connected axis.
C005	Could not read 2 or 4 bytes.	Check whether the required safety function is supported by the connected axis.

4 Requirements for immunity to disturbances (EMC)

- EN 61800-3 requirements apply.
- For all modules that have certified safety functions, stricter requirements apply for section 4.3 "High-frequency disturbances per EN 61800-3" per IEC 61800-5-2.

4.1 Evaluation criteria (performance criteria)

Performance criteria (PC)	Description			
A	The test object is not interfered with during testing.			
В	The test object is only interfered with temporarily during testing.			
С	The system does not reboot itself automatically (reset required).			
FS	Functional safety - Behavior of test object per EN 61800-5-2, item 6.2.5.3			

Table 643: Evaluation criteria (performance criteria) for immunity to disturbances

4.2 Low-frequency disturbances in accordance with EN 61800-3

The following limit values are applicable for industrial environments (category C3).

Power mains harmonics and commutation notches / voltage distortions

IEC 61000-2-4, class 3		
	EN 61800-3	Performance criteria
Harmonics	THD = 12%	Α

Table 644: Limit values for power mains harmonics

IEC 60146-1-1, class B		
	EN 61800-3	Performance criteria
Commutation notches	Depth = 40%,	A
	Total area = 250% in % degrees	

Table 645: Limit values for commutation notches / voltage distortions

Voltage deviations, voltage dips and short-term interruptions

IEC 61000-2-4, class 2		
	EN 61800-3	Performance criteria
Voltage deviations (>60 s)	±10%	A

Table 646: Limit values for voltage deviations

IEC 61000-4-34, class 3				
	EN 61800-3		Performance criteria	
	Remaining volt-	Periods		
	age			
Voltage dips	0%	1	С	
	40%	10/12 1)		
	70%	25/30 1)		
	80%	250/300 1)		
Short-term interruptions	0%	250/300 1)		

Table 647: Limit values for voltage dips and short-term interruptions

Voltage unbalance and frequency changes

IEC 61000-2-4, class 3		
	EN 61800-3	Performance criteria
Voltage unbalance	3% of negative component	A

Table 648: Limit values for voltage unbalance

IEC 61000-2-4					
	EN 61800-3	Performance criteria			
Frequency changes	±2%	A			
	(±4% if the power supply is isolated				
	from public power supply networks)				
Speed of frequency change	1%/s	1			
	(2%/s if the power supply is isolated				
	from public power supply networks)				

Table 649: Limit values for frequency changes

^{1) &}quot;x/y periods" means "x periods for 50 Hz test" and "y periods for 60 Hz test".

4.3 High-frequency disturbances in accordance with EN 61800-3

These immunity tests are applicable for industrial environments (category C3).

Electrostatic discharge

Tests in accordance with EN 61000-4-2					
EN 61800-3 Increased immunity to disturbances					
	Requirement	PC	Requirement 1)	PC	
Contact discharge to powder-coated and bare metal housing	4 kV	В	6 kV	FS	
parts					
Discharge through the air to plastic housing parts	8 kV		15 kV		

Table 650: Limit values for electrostatic discharge

 The total number of discharges depends on the required safety integrity level (SIL) and can be found in IFA (formerly BGIA): EMC and functional safety for power drive systems 2/2012.

Electromagnetic fields

Tests in accordance with EN 61000-4-3				
	EN 61800-3		Increased immunity to disturbances	
	Requirement	PC	Requirement	PC
Housing	80 MHz to 1000 MHz 10 V/m	А	80 MHz to 1000 MHz 20 V/m	FS
	80% amplitude modulation (1 kHz)		80% amplitude modulation (1 kHz)	-
	1.4 GHz to 2.0 GHz	7	1.4 GHz to 2.0 GHz	
	3 V/m		10 V/m	
	80% amplitude modulation (1 kHz)		80% amplitude modulation (1 kHz)	
	2.0 GHz to 2.7 GHz	1	2.0 GHz to 2.7 GHz	
	1 V/m		3 V/m	
	80% amplitude modulation (1 kHz)		80% amplitude modulation (1 kHz)	

Table 651: Limit values for electromagnetic fields

Burst

Tests in accordance with EN 61000-4-4					
	EN 61800-3 Increased immunity to disturbances				
	Requirement	PC	Requirement 1)	PC	
Power supply connections	2 kV, 1 min, direct coupling	В	4 kV, direct coupling	FS	
Connections for process measurement, open-loop and closed-	2 kV, 1 min]	4 kV]	
loop process control					
Signal interfaces	1 kV, 1 min		2 kV]	

Table 652: Limit values for burst

 The duration of the effect depends on the required safety integrity level (SIL) and can be found in IFA (formerly BGIA): EMC and functional safety for power drive systems 2/2012.

Surge

Tests in accordance with EN 61000-4-5				
	EN 61800-3		Increased immunity to disturba	nces
	Requirement	PC	Requirement 1)	PC
Power supply connections	1 kV, DM, symmetrical 2 kV, CM, asymmetrical	В	2 kV, DM, symmetrical 4 kV, CM, asymmetrical	FS
Connections for process measurement, open-loop and closed-loop process control	1 kV, CM, asymmetrical		2 kV, CM, asymmetrical	
Signal interfaces			0.5 kV, CM, asymmetrical	

Table 653: Limit values for surge

 The number of pulses depends on the required safety integrity level (SIL) and can be found in IFA (formerly BGIA): EMC and functional safety for power drive systems 2/2012.

High-frequency conducted disturbances

Tests in accordance with EN 61000-4-6						
	EN 61800-3		Increased immunity to disturbances			
	Requirement	PC	Requirement	PC		
Power supply connections	0.15 MHz to 80 MHz	Α	0.15 MHz to 80 MHz	FS		
Connections for process measurement, open-loop and closed-			20 V			
loop process control	80% amplitude modulation (1 kHz)		80% amplitude modulation (1 kHz)			
Signal interfaces						

Table 654: Limit values for high-frequency conducted disturbances

5 Requirements for emissions (EMC)

5.1 High-frequency emissions in accordance with EN 61800-3

These emission tests are applicable for industrial environments (category C3).

Disturbance voltages on the mains connections

Tests in accordance with EN 55011						
Continuous current I	Frequency band [MHz]	Quasi-peak value [dB (µV)]	Average value [dB (μV)]			
	0.15 ≤ f < 0.5	100	90			
	0.5 ≤ f < 5	86	76			
I ≤ 100 A	5 ≤ f < 30	90	80			
		Decreases with the loga-	Decreases with the loga-			
		rithm of the frequency to 70	rithm of the frequency to 60			
	0.15 ≤ f < 0.5	130	120			
100 A < I	0.5 ≤ f < 5	125	115			
	5 ≤ f < 30	115	105			

Table 655: Limit values for disturbance voltages on power mains connection

Radiated emissions

Tests in accordance with EN 55011				
Frequency band [MHz]	Limit values of the quasi-peak value [dB (μV/m)]			
30 ≤ f ≤ 230	50 1)			
230 < f < 1000	60 1)			

Table 656: Limit values for radiated emissions

6 Additional environmental limit values in accordance with EN 61800-2

ACOPOSmulti SafeMOTION, ACOPOS P3 SafeMOTION

	EN 61800-2
Pollution degree in accordance with EN 61800-5-1	2 (non-conductive pollution)
Overvoltage category in accordance with EN 61800-5-1	III
EN 60529 protection	IP20
Reduction of the continuous current at installation elevations over 500 m above sea level	10% per 1000 m
Maximum installation elevation	4000 m ¹⁾

Table 657: Additional environmental limit values

ACOPOSmotor SafeMOTION

	EN 61800-2
Pollution degree in accordance with EN 61800-5-1	2 (non-conductive pollution)
Overvoltage category in accordance with EN 61800-5-1	III
EN 60529 protection	IP65
Reduction of the continuous current at installation elevations over 500 m above	10% per 1000 m
sea level	
Maximum installation elevation	4000 m ¹⁾

Table 658: Additional environmental limit values

Requirements that go beyond this must be arranged with B&R.

¹⁾ Test distance 10 m.

¹⁾ Requirements that go beyond this must be arranged with B&R.

7 International certifications

B&R products and services comply with applicable standards. This includes international standards from organizations such as ISO, IEC and CENELEC, as well as national standards from organizations such as UL, CSA, FCC, VDE, ÖVE, etc. We are committed to ensuring the reliability of our products in an industrial environment.

Certifications	
Europe	B&R products with this mark satisfy all harmonized EN standards for the applicable guidelines.
C (UL) US	B&R products with this mark are tested and listed by Underwriters Laboratories and checked quarterly by a UL inspector. This mark is valid for the USA and Canada and simplifies the certification of your machines and systems in these regions.
E225616	Products with this mark have been tested by an accredited testing laboratory and approved for import to the Russian Federation.
EHC	Products with this mark have been tested by an accredited testing laboratory and approved for import to the Eurasian Economic Union.
	Products with this mark have been tested by an accredited testing laboratory and approved for import to the Korean market.
SAFETY certified product	Products with this mark were designed, developed and manufactured for special applications for machine and personnel protection. The products are certified by the recognized authorities (TÜV Rheinland, TÜV Süd).

Table 659: International certifications

SafeMOTION User's Manual V 4.6.1

8 Standards and definitions for safety technology

Stop functions per EN 60204-1 (Electrical equipment of machines, Part 1: General requirements)

There are three categories of stop functions:

Category	Description
0	Stopping by immediate removal of power to the machine actuators (i.e. an uncontrolled stop).
1	A controlled stop with power left available to the machine actuators to allow for stopping. Power is only interrupted when standstill is achieved.
2	A controlled stop with power left available to the machine actuators.

Table 660: Overview of stop function categories

The necessary stop functions must be determined based on a risk assessment of the machine. Category 0 and category 1 stop functions must be functional regardless of operating mode. A category 0 stop must have priority. Stop functions must have priority over assigned start functions. Resetting the stop function is not permitted to trigger a dangerous state.

Emergency stops per IEC 60204-1:2006 (Electrical equipment of machines, Part 1: General requirements)

In addition to the requirements for stop functions, the emergency stop function has the following requirements:

- It shall override all other functions and operations in all modes.
- Power to the machine actuators that can cause a hazardous situation shall be removed as quickly as
 possible without creating other hazards.
- · A reset is not permitted to initiate a restart.

Emergency stops must be category 0 or category 1 stop functions. The necessary stop function must be determined based on a risk assessment of the machine.

Performance levels (PL) per EN ISO 13849-1 (Safety of machinery - Safety-related parts of control systems, Part 1: General principles for design)

The safety-related parts of control systems must meet one or more of the requirements for five defined performance levels. These performance levels define the required behavior of safety-related controller parts with regard to their resistance to errors.

Performance level (per EN ISO 13849-1)	Safety integrity level - SIL (per IEC 61508-2)	Short description	System behavior
а		Safety-related components must be designed and built in such away that they can meet the expected operational requirements (no specific safety measures are implemented).	Caution! The occurrence of a fault can lead to the loss of safety functionality.
b	1	Safety-related components must be designed and built in such a way that only reliable components and safety principles are used (e.g. preventing short circuits by using sufficient distances, reducing the probability of errors by using oversized components, defining the failure route, idle current principle, etc.).	Caution! The occurrence of a fault can lead to the loss of safety functionality.
С	1	Safety related parts shall be designed so that their safe- ty functions shall be checked at suitable intervals by the machine control system. (e.g. automatic or manual check during start-up)	Caution! An error between checks can cause the loss of safety functionality. The loss of safety functionality will be detected during the check.
d	2	Safety-related parts shall be designed so that a single fault does not lead to the loss of the safety function. Individual errors should – if possible – be detected the next time (or before) the safety function is required.	Caution! Safety functionality remains active when an error occurs. Some but not all errors are detected. A buildup of undetected errors can cause safety functionality to fail.
е	3	Safety-related parts shall be designed so that a single fault does not lead to the loss of the safety function. Individual errors must be detected the next time (or before) the safety function is required. If this type of detection is not possible, a buildup of errors is not permitted to cause safety functionality to fail.	Information: Safety functionality remains active when an error occurs. Errors are detected in time to prevent safety functionality from failing.

Table 661: Overview of performance levels (PL)

A suitable performance level must be selected separately for each drive system (or for each axis) based on a risk assessment. This risk assessment is a part of the total risk assessment for the machine.

The following risk graph (per EN ISO 13849-1, appendix A) provides a simplified procedure for risk assessment:

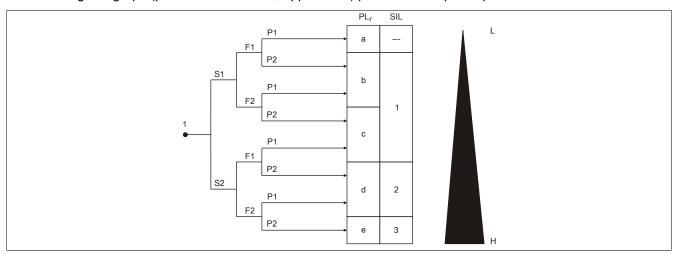

Figure 129: Risk diagram for determining the PL_r for each safety function per EN ISO 13849-1, appendix A

Legend:

- 1 Starting point for assessing the impact on risk reduction
- L Low contribution to risk reduction
- H High contribution to risk reduction
- PL_r Required performance level
- SIL Safety Integrity Level per IEC 61508-2

Risk parameters

- S Severity of injury
- S1 Slight (normally reversible injury)
- S2 Serious (normally irreversible injury or death)
- F Frequency and/or duration of the exposure to the hazard
- F1 Seldom to less often and/or exposure time is short.
 F2 Frequent to continuous and/or exposure time is long.
- F2 Frequent to continuous and/or exposure time is long.
 P Possibility of avoiding hazard or limiting harm
- P1 Possible under specific conditions
- P2 Scarcely possible

The performance level to be used is determined by starting at the specified starting point and taking the risk parameters S, F and P into consideration.

Restart interlock per EN 1037/04.96 (Safety of machinery - Prevention of unexpected startup)

Keeping a machine in a state of rest while personnel are working in the danger zone is one of the most important requirements for safely operating machines.

Startup refers to the transition of a machine or its parts from a state of rest to a moving state. A startup is considered unexpected if caused by one of the following:

- · A startup command generated due to controller failure or external influences on the controller.
- A startup command generated due to incorrect operation of a startup control actuator or another part of the machine.
- · Restoration of the power supply after an interruption.
- External/Internal influences on parts of the machine.

To prevent unexpected startup of machines or parts of machines, power should be removed and dissipated. If this is not practical (e.g. frequent brief interventions in danger zones), other measures must be taken:

- Measures to prevent randomly generated startup commands.
- · Measures to prevent randomly generated startup commands from causing unexpected startup.
- Measures to automatically stop the dangerous part of the machine before a dangerous situation can be caused by unexpected startup.

Appendix A • EC declaration of conformity

Table 664: Safety level for SafeMOTION integrated safety technology with B&R motors

SafeMOTION User's Manual V 4.6.1

The actual safety level that can be achieved depends on the external wiring!

In order to achieve Cat. 4 / PL e / SIL 3, special certified encoders are needed that meet B&R's catalog of requirements.
 Only 1-axis modules are available for ACOPOSmulti SafeMOTION SinCos inverter modules due to the amount of space inside the device.

²⁾ The safety functions are configured using SafeDESIGNER.

		B&R motor	options

SLT ⁴⁾	Cat. 3 / PL d / SIL 2						

Table 664: Safety level for SafeMOTION integrated safety technology with B&R motors

- 1) Motors with a B8, B9, D0, D1, E0, E1, E4, E5, E6 or E7 encoder option do not have a safety-oriented encoder mount. For information regarding their limited use, see chapter "Safety technology Safe monitoring without fault exclusion" of the SafeMOTION user's manual.
- 2) B&R motor and encoder cables must be used (see SafeMOTION user's manual).
- 3) Safety function SBC for safety-oriented control of a safe motor holding brake achieves a maximum safety level of Cat. 3 / PL d / SIL 2 depending on the safety level of the motor holding brake being controlled.
- Only for synchronous motors.

Table 665: Safety level for SafeMOTION integrated safety technology with 3rd-party motors

- 1) This safety function can only be used if a third-party motor is demonstrably equipped with a safe encoder mounting.
- ACOPOSmulti SafeMOTION SinCos inverter modules are certified up to Cat. 4 / PL e / SIL 3. In order to achieve this level, special certified encoders are needed that meet B&R's catalog of requirements.
- 3) When using third-party motors for applications with FS (functional safety), other measures may need to be taken (e.g. using B&R motor and encoder cables). In addition, the catalog of measures from manufacturers of products (e.g. encoder manufacturer) used throughout the entire safety system must be taken into consideration. For details, see the SafeMOTION user's manual.
- 4) Safety function SBC for safety-oriented control of a safe motor holding brake achieves a maximum safety level of Cat. 3 / PL d / SIL 2 depending on the safety level of the motor holding brake being controlled.
- 5) Only for synchronous motors.
- 6) Model number (with regard to incremental signals) of manufacturer DR. JOHANNES HEIDENHAIN GmbH (www.heidenhain.de)

Danger!

The safety functions used are only permitted to be configured and used as described in 4 "Integrated safety functions" on page 322.

Danger!

The steps listed under 7.5 "Maintenance scenarios" on page 485 must be observed.
